INTACS AUTOMATED SYSTEM MANAGEMENT INFORMATION PROCESSES

Contract DAAK21-79-C-0161

September 30, 1981

Prepared for:

Commandant, USASC & FG

Fort Gordon, Georgia

Martin Marietta Aerospace

Denver Division

Denver, Colorado 80201

FOREWORD

The INTACS Transition and Management Plan defined the Automated System Management Information (ASMI) concept. The ASMI process provides the operating guidelines, as well as the implementing and operating procedures within the Systems Integration Management Office (SIMO) by which all commands and agencies concerned with INTACS Transition will receive timely reports and schedules. In order to implement the ASMI concept, the procedures within SIMO as well as the interfaces with external commands and agencies must be defined and put into a standard operating procedure.

The INTACS Automated Systems Management Information Processes was initiated to provide the link between the Automated Transition Plan and the implementers of this plan. Through this system, users will receive basic packages of transition reports and schedules on a periodic basis and may request audit and reference information as required.

The INTACS Automated System Management Information Processes was prepared by Martin Marietta Corporation for the U.S. Army Signal Center, Directorate of Combat Developments in accordance with the provisions of Contract DAAK21-79-C-0161.

1.0 INTRODUCTION/SUMMARY

1.1 TRANSITION PLANNING

The Systems Integration Management Office (SIMO) approach to transition planning supports intensive management of INTACS, requires valid inputs, and is automated to provide timely outputs.

Figure 1-1 shows the SIMO transition planning approach which accepts recurring inputs and results in continuously updated output Transition Plan. While the INTACS progresses from current to future tactical communications systems, the details of each step reside in the Automated Transition Management System and data base.

SIMO developes and drives the Automated Transition Plan. Detailed equipment/assemblage lists and a series of five (5) network force models depict the transition to future systems. Major parts of the Plan are annual equipment acquisition and distribution to specific units of the force. Planned expansion will incorporate training impacts considerations and personnel availability in support of equipment according to fielding schedules.

The Plan provides details to managers and project officers who are engaged in implementing plans and actions. Then, the Automated Transition Management System is able to electronically read the status of these implementing plans and actions. Planned specific forces, TOE or BOI, expected budget and cost and the current status of equipments in the field are the major related items.

The point of departure (Baseline) for any working and steering groups who are considering changes to current or to future tactical communications should be the current set of Transition Plans as provided by SIMO. When approved, the changes made by the working and steering groups appear as implementing plans or actions, and result in changes to some or all of the inputs to SIMO. These inputs and the outputs from SIMO are planned to be distributed by an automated system within HQDA.

1.2 ARCHITECTURE PROCESSES (Figure 1-2)

Within SIMO, the INTACS Architecture Integration Function drives the Transition Planning and Implementation Functions. Changes to Architecture are handled in the steps: Changes Definition, Impact Evaluation and Incorporation.

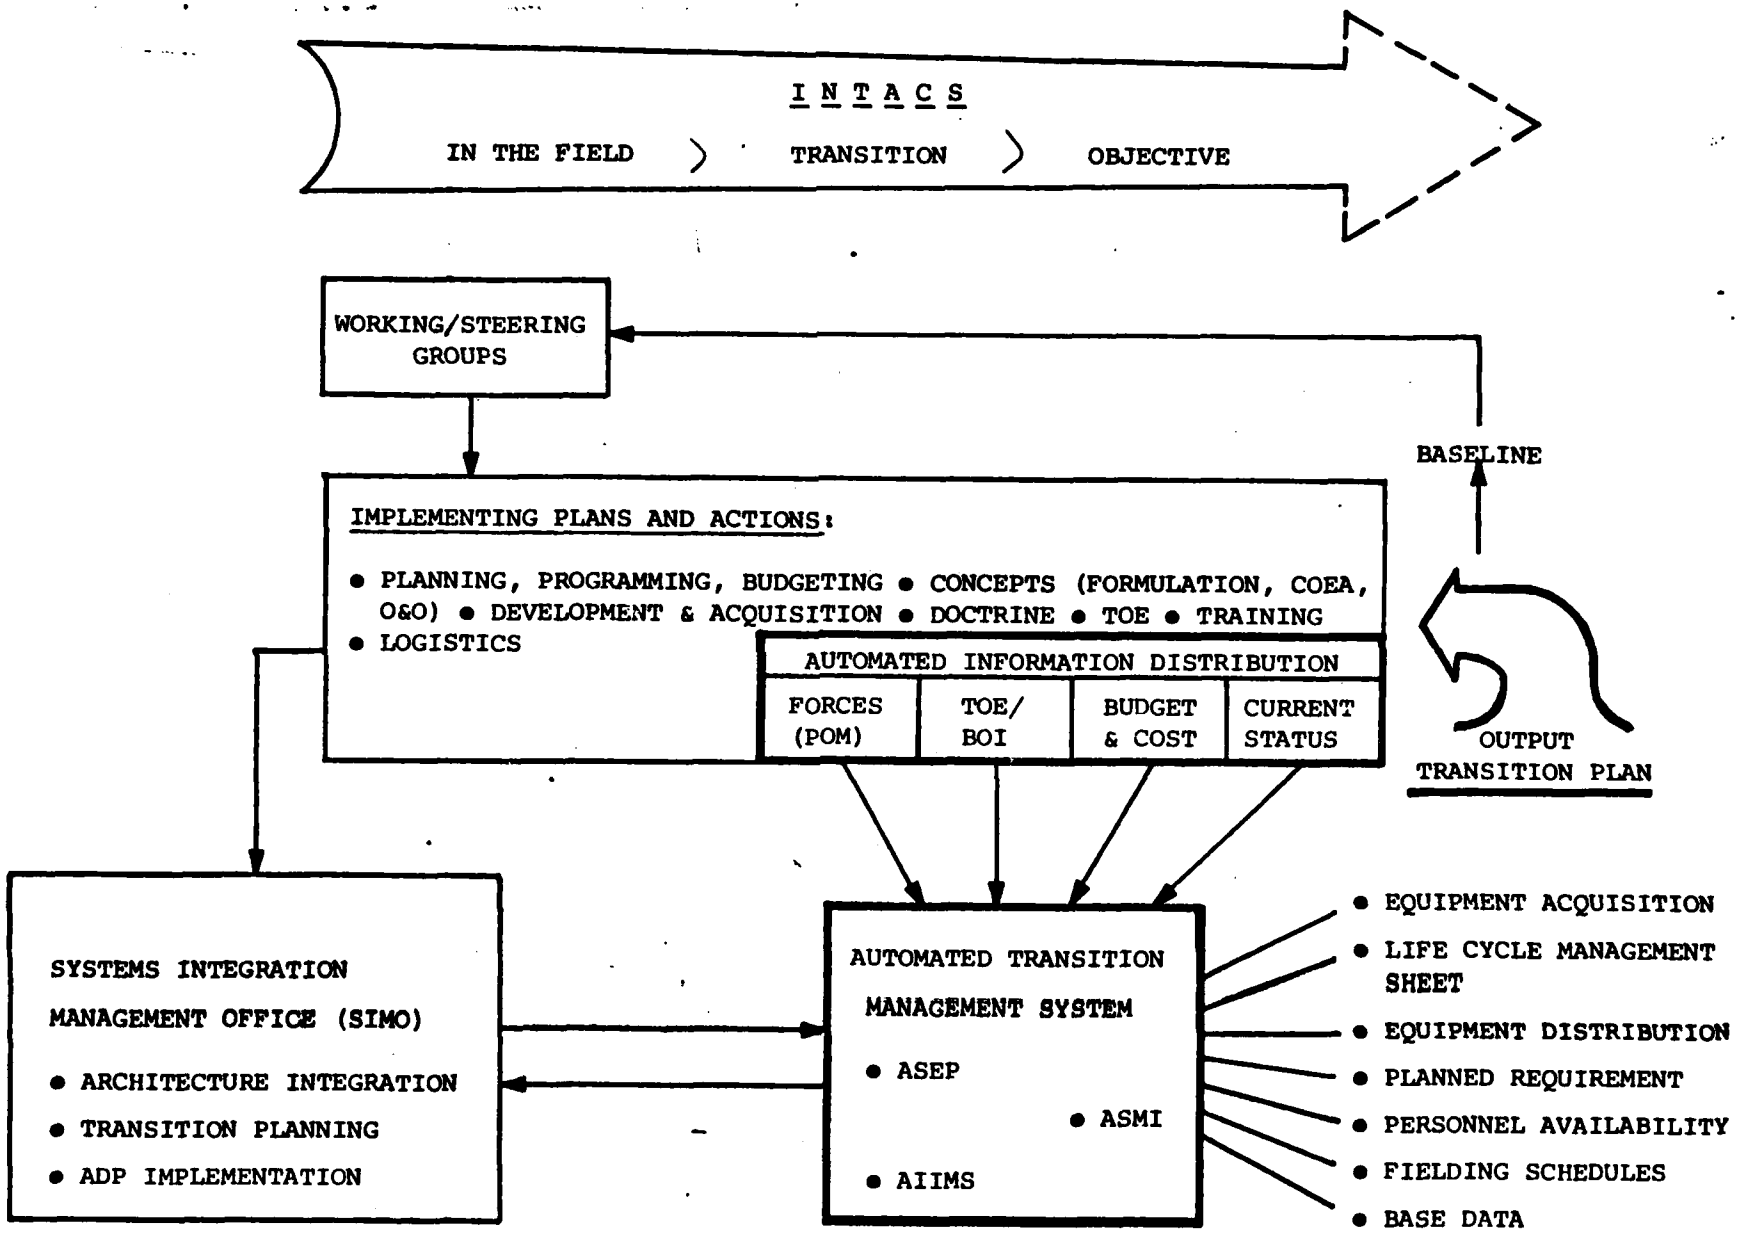

FIGURE 1-1 TRANSITION PLANNING

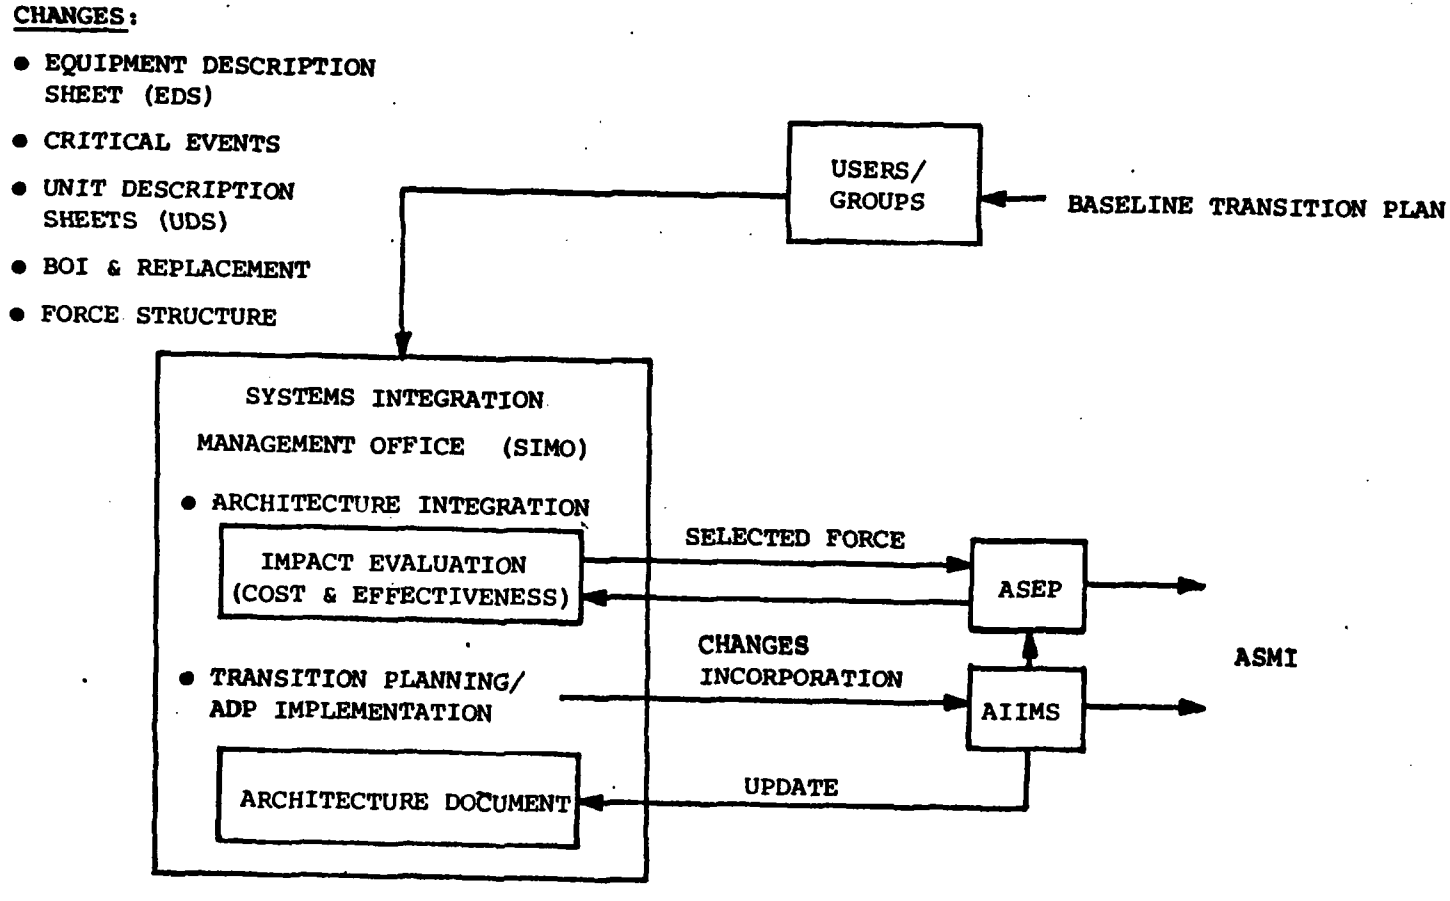

Figure 1-2 ARCHITECTURE CHANGE PROCESSES

Listed on Figure 1-2 are the essential inputs that are necessary for defining changes to the Architecture and Transition Plan. SIMO evaluates the impact on a selected force of significant conceptual and implementation changes using automated system evaluation and implementation programs. After approval, changes are incorporated into the data base and into the Architecture document.

1.3 ASMI CONCEPT (Figure 1-3)

This Automated System Management Information (ASMI) Process provides the operating guidelines, as well as the implementing and operating procedures, to establish the system within SIMO. This system will be the means through which all commands and agencies concerned with the INTACS Transition will receive timely reports and schedules. Update inputs through the same automated system will further insure that reports and schedules information is the latest available and that all users are working from a common data base.

ASMI is interwoven with the management functions and structure of SIMO so that it is inherently a part of the system (see Figure 1-3). Within this context, it is an automated tool so that the managers involved can start, modify and stop transitional processes in an effective manner. It also provides a means of control of the process whereby excursions or modifications of the transition program can be studied and compared without any disruptive effects on projects in progress.

1.4 ASMI PROCEDURES

ASMI is designed to provide information to managers that will assist them in performing their roles throughout the transition. Specific reports are to be generated that show status at any period, overall and specific requirements into the future and provide a means for comparing actual progress versus planned. These reports establish a management means for equipment planning, procurement and distribution as well as defining training requirements and providing system evaluation information. The ASMI reports and schedules are provided to the users on a periodic and demand basis and an automated log is kept to insure delivery as required. Local users are

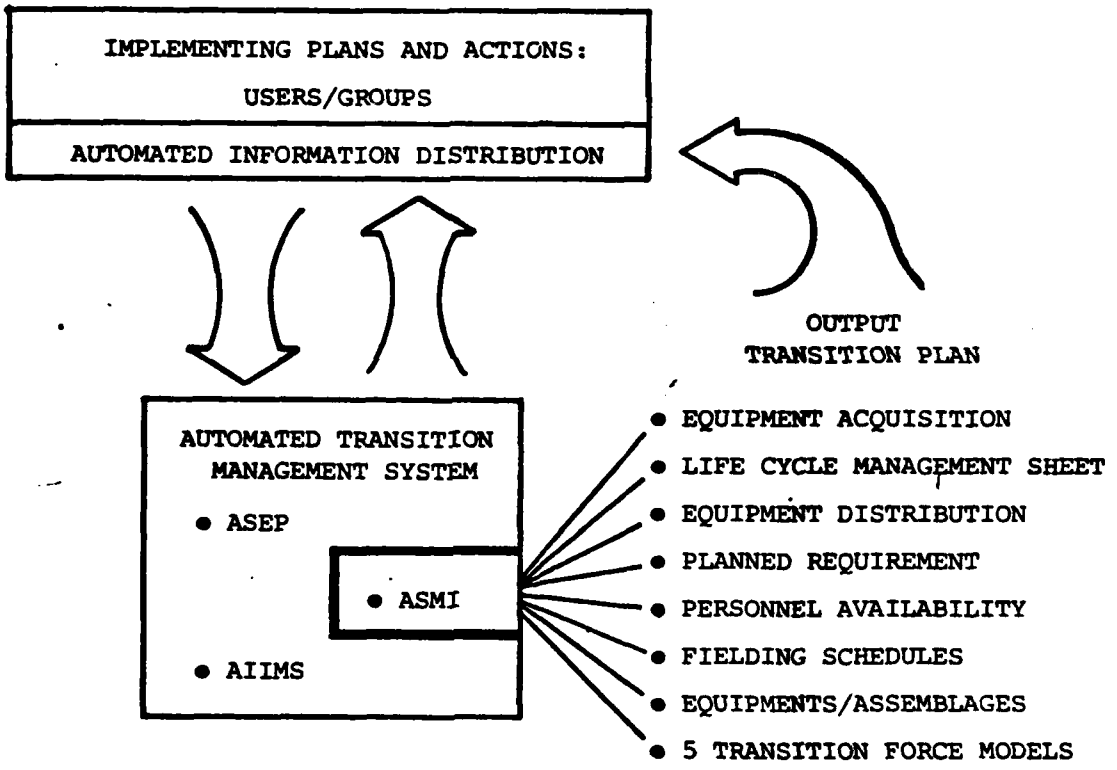

Figure 1-3 ASMI CONCEPT

provided over-the-counter service while remote users receive service via electronic mail by a computer/communications network (Figure 1-4).

1.5 ASMI REFERENCE HANDBOOK

This handbook provides a ready reference for SIMO on the functions and contents of ASMI. Master program lists, user lists, report schedules and program status are contained therein and are kept current through automated update.

The remaining sections of this report expand the Architecture and the ASMI processes of SIMO that are summarized in this first section.

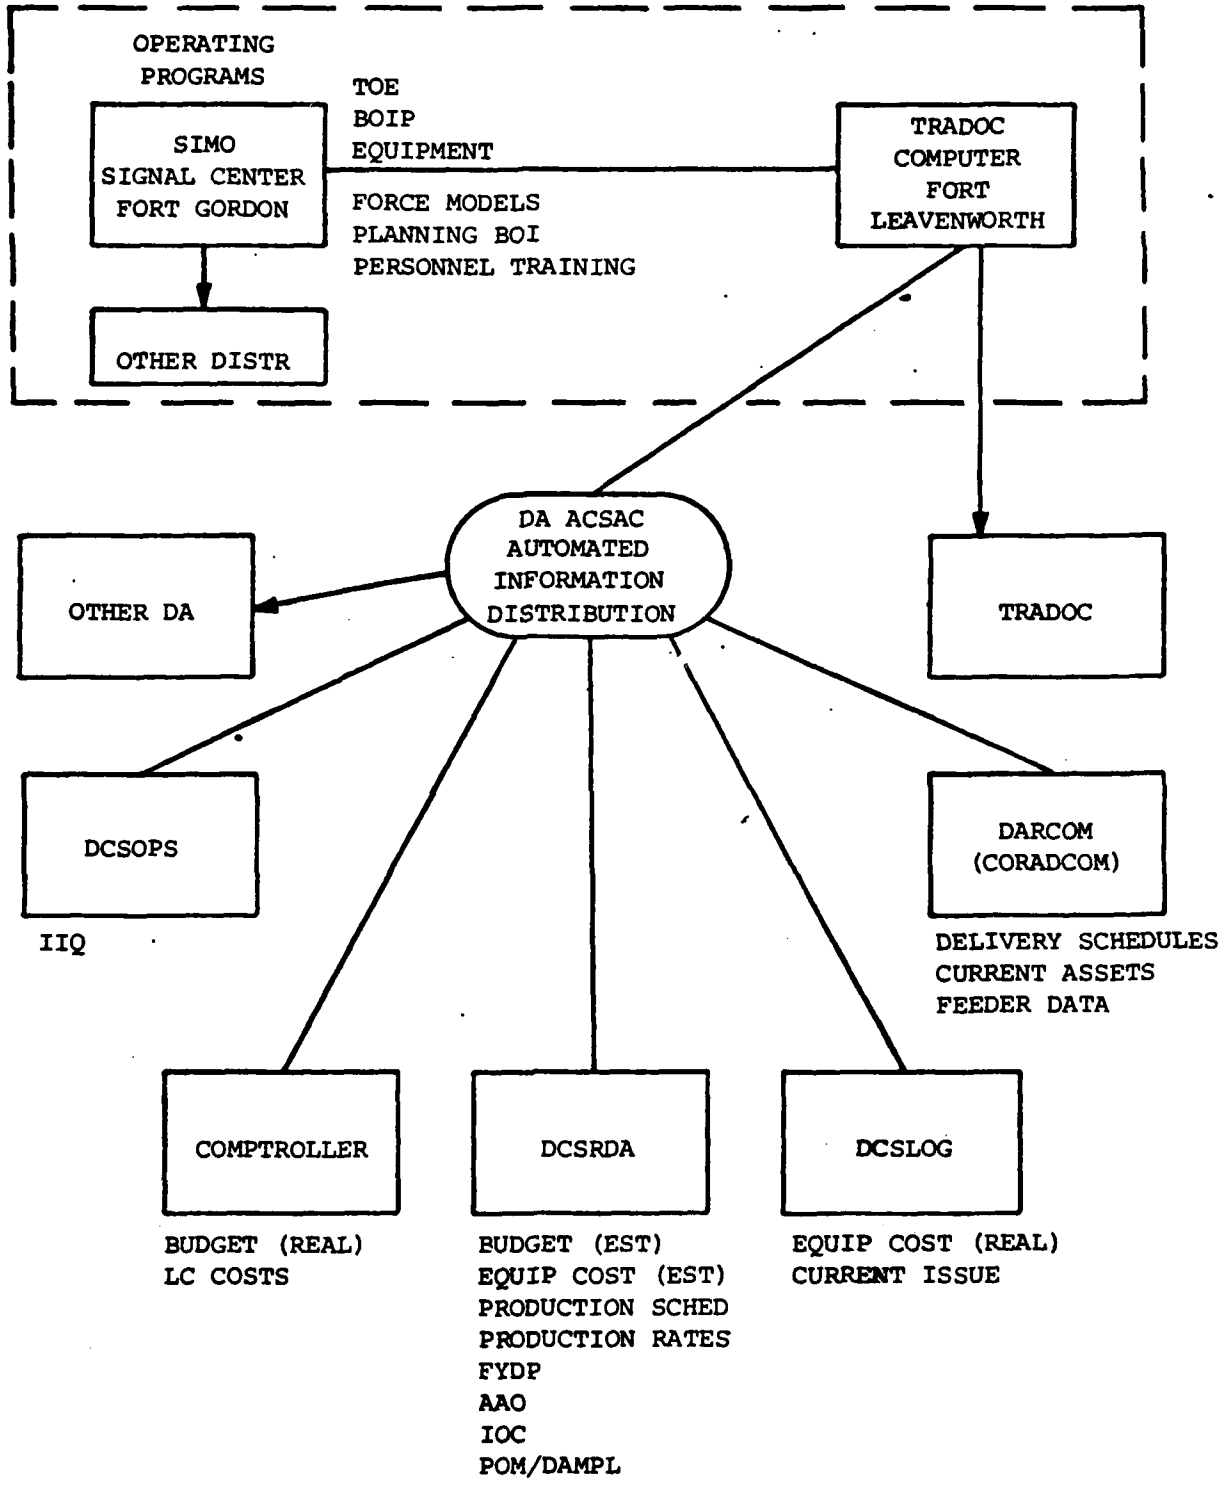

Figure 1-4 SIMO INPUT, OUTPUT DISTRIBUTION SYSTEM

2.0 ARCHITECTURE CHANGE PROCESSES

2.1 PROCESS FOR DEFINITION OF CHANGES

Changes to INTACS Architecture are defined by converting implementing plans/ actions such as computer records, approved documents and consultation with the working group into the inputs required to update document and implementation planning data base.

Working groups and action officers in tactical communications develop plans and insert records into the TRADOC Automated Force Development centralized computer files. When these records are available in that data base, changes to Architecture can be defined through computer-assisted analysis. Mission Area Analysis, O&O Concept and other documents also support changes, and where ambiguity exists, direct consultation with the working/action officer is employed. Changes incurred from Division-86 TOE series S,K,A and Mission Area Analysis are summarized on Table 2-I as examples of implementing plans and actions which impact on Architecture. These process for Architecture changes definition using automated and manual analysis programs and the form of required input are listed also.

The USASC&FG portion of Division-86 TOE series in the centralized computer files are read electronically utilizing TRADOC TOE header list program TEP 32. Review of the TEP 32 printout reveals that implementation of the Division-86 TOE series will cause restructure of the current AIM Division into a Heavy Division structure for Armor or Mechanized Infantry and a Light Division structure for Infantry. The next step determines what impact this restructure has on personnel and equipment.

Using today's current "H" series AIM Division TOE as the baseline, TRADOC Evaluation Program TEP 19 electronically reads the data base and provides output prints that compare each Division-86 TOE in each series with the baseline. These comparisons define changes in personnel and equipment that are planned to the AIM Division by 1986. The input to be done manually and the form of input required to describe the change in Architecture is listed for each type of major change. For example, an increase of 99 O&O personnel in the Division Signal Battalion for the "S" series Heavy Division is shown. This personnel increase is entered into the Architecture by manual update of the organizational diagram page of the Unit Description Sheet. In addition, equipment with an IOC of 1986 has been added to the Division Signal Battalion and the issue basis defined.

TABLE 2-I

ARCHITECTURE CHANGES DEFINITION SUMMARY

TOE SERIES	VARIATION	MAJOR CHANGE	PROCESS AUTOMATED	PROCESS MANUAL	ARCHITECTURE INPUT

A	100	RESTRUCTURE TO HEAVY & LIGHT DIVISION	TEP 32		
		-O&S PERSONNEL INCREASE	TEP 19	ORGANIZATION DIAGRAM	UDS
		-IOC 1983 EQUIPMENT ADDED	TEP 19	DESCRIBE EQUIPMENT & COMPONENTS, DEFINE ISSUE BASIS	EDS BOI
TACTICAL COMMUNICATIONS MISSION AREA ANALYSIS				REVIEW	CONCEPT SUMMARY
		PLRS/JTIDS HYBRID			
		-O&S PERSONNEL INCREASE		SIG BN ORGANIZATION DIAGRAM	UDS
		-EARLY IOC 1986 EQUIPMENT ADDED		DESCRIBE EQUIPMENT & COMPONENTS, DEFINE ISSUE BASIS	EDS BOI
		IMPROVED HF		DESCRIBE EQUIPMENT & COMPONENTS, DEFINE ISSUE BASIS	EDS BOI

This equipment with a list of all it's components is manually input into the Architure in the form of Equipment Description Sheets. Definition of added equipment issue basis is used as input to update Basis of Issue information for all equipment in the data base and for major equipment in Architecture. The changes in TOE Series K and A which reflect plans prior to 1986 are defined in a similar manner as listed on Table 2-I.

Manual review of the Mission Area Analysis documents identify O&O personnel and equipments that will be fielded during the same time period covered by the Division-86 TOE series S. However, these PLRS/JTIDS Hybrid and improved HF equipments did not appear in the TEP 19 TOE comparisons. Since ambiguity exists between Division-86 TOE series computer files and Mission Area Analysis documents, direct consultations between SIMO and the working groups that originated the records is required. Upon resolution of the ambiguity, it is assumed the centralized computer files will be updated to reflect the current information. The MAA also recommended development of doctrine for a Division Area Multichannel System which is already in the Architecture.

There is an indication that the data contained in the Division-86 TOE series S, K, and A is of questionable value and should eventually be put into historical computer files. The process for change definition described here is valid, but will require manual revision unless accurate TOE records are inserted into the centralized computer files. To realize the full value of automated analysis programs for timely and accurate update of Architecture requires that centralized computer files be kept current.

The next section describes how automation supports the evaluation of impact of these or other changes in Architecture.

2.2 IMPACT EVALUATION

Application of the evaluation process results in quantitative cost and effectiveness data which details the impacts of changes to the architecture. This data is useful as basis for: assessment of impacts, assuring system integrity, selection/justification of alternatives and decision.

The process focuses on comparisons of alternative equipments and O&O personnel in a selected force. As shown in Figure 2-1, the Automated System Evaluation Program (ASEP) operates with AIIMS and TOE analysis programs, and allows manual selection of small to large force (military units) for modeling.

Comparisons of equipments costs along with operations and support personnel pay and allowance cost are provided by the TOE analysis programs (TEP) which read the automated TOE Series and equipment files. These three costs are in the primary

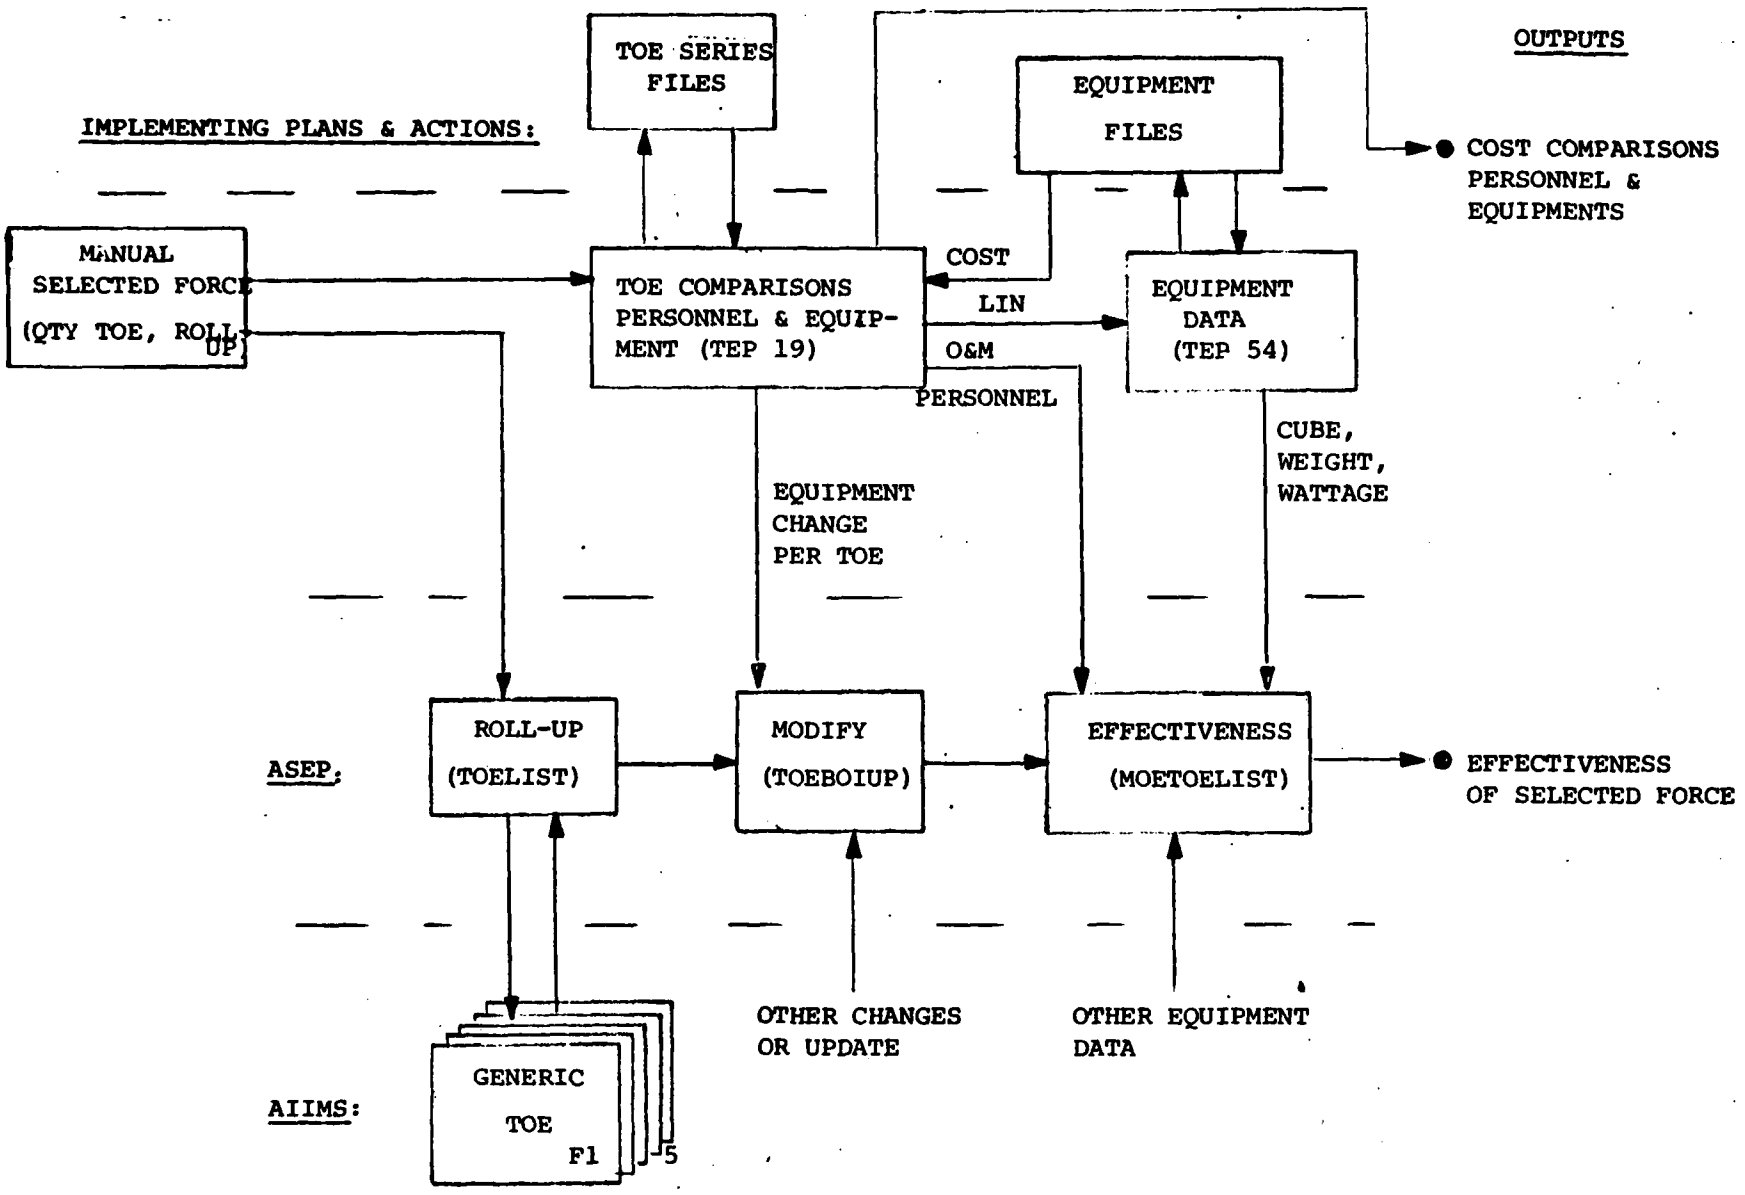

Figure 2-1 AUTOMATED ARCHITECTURE IMPACT EVALUATION

drivers of life cycle costs.

ASEP pulls from AIIMS a base Force Model which reflects the transition phase of interest, and then incorporate alternative equipments changes as delineated by the current and planning TOE Series. Comparisons of quantitative measures of effectiveness, such as cube (volume), weight, power, reliability, maintainability standardization and number of support personnel, are then provided for analysis. The computer outputs of the Architecture Impact Evaluation Process are illustrated and described in Appendix B.

Eventually, the ASEP is planned to be expanded to include total life cycle costs and automated graphs as shown on Figure 2-2.

The next section describes how the Automated Transition Management System aids the incorporation of changes into the Architecture and Transition Plan.

2.3 CHANGE INCORPORATION PROCESS

The Automated Transition Management System is used first as a tool to incorporate changes to Architecture, and then Architecture drives the Transition Plan assuring complete consistency and rapid update. The loop is close to a Concept and Data Base Summary Table which reflects and notifies the changes that are in the data base.

The INTACS Architecture is flexible to changes in requirements, concepts. equipments, and force structure. Personnel in SIMO will incorporate approved changes easily, since the documentation is directly supported by Automated System Management Information (ASMI). In the beginning, the Concept and Data Base Summary on Table 2-II depicts introduced - equipments and support personnel of the Communications Concept as they change in five stages of transition at low to high echelons. The format for the automated Concept and Data Base Summary is shown on Table 2-III.

The three steps of the Architecture Change Incorporation Process are summarized on Figure 2-3 along with the relationships with ASMI. As a result of a significant change, the Concept and Data Base Summary Table is automatically updated to reflect the essence of the change in time-phasing, equipments and personnel. This Table accurately depicts the Concept as actually embodied within the Automated Transition Management System. Procedures for architecture changes in Transition Concept, Communication Support Plan and Implementation guidelines chapters of INTACS Architecture follow:

Step 1:

Input to AIIMS each added equipment described in the form of EDS to be located

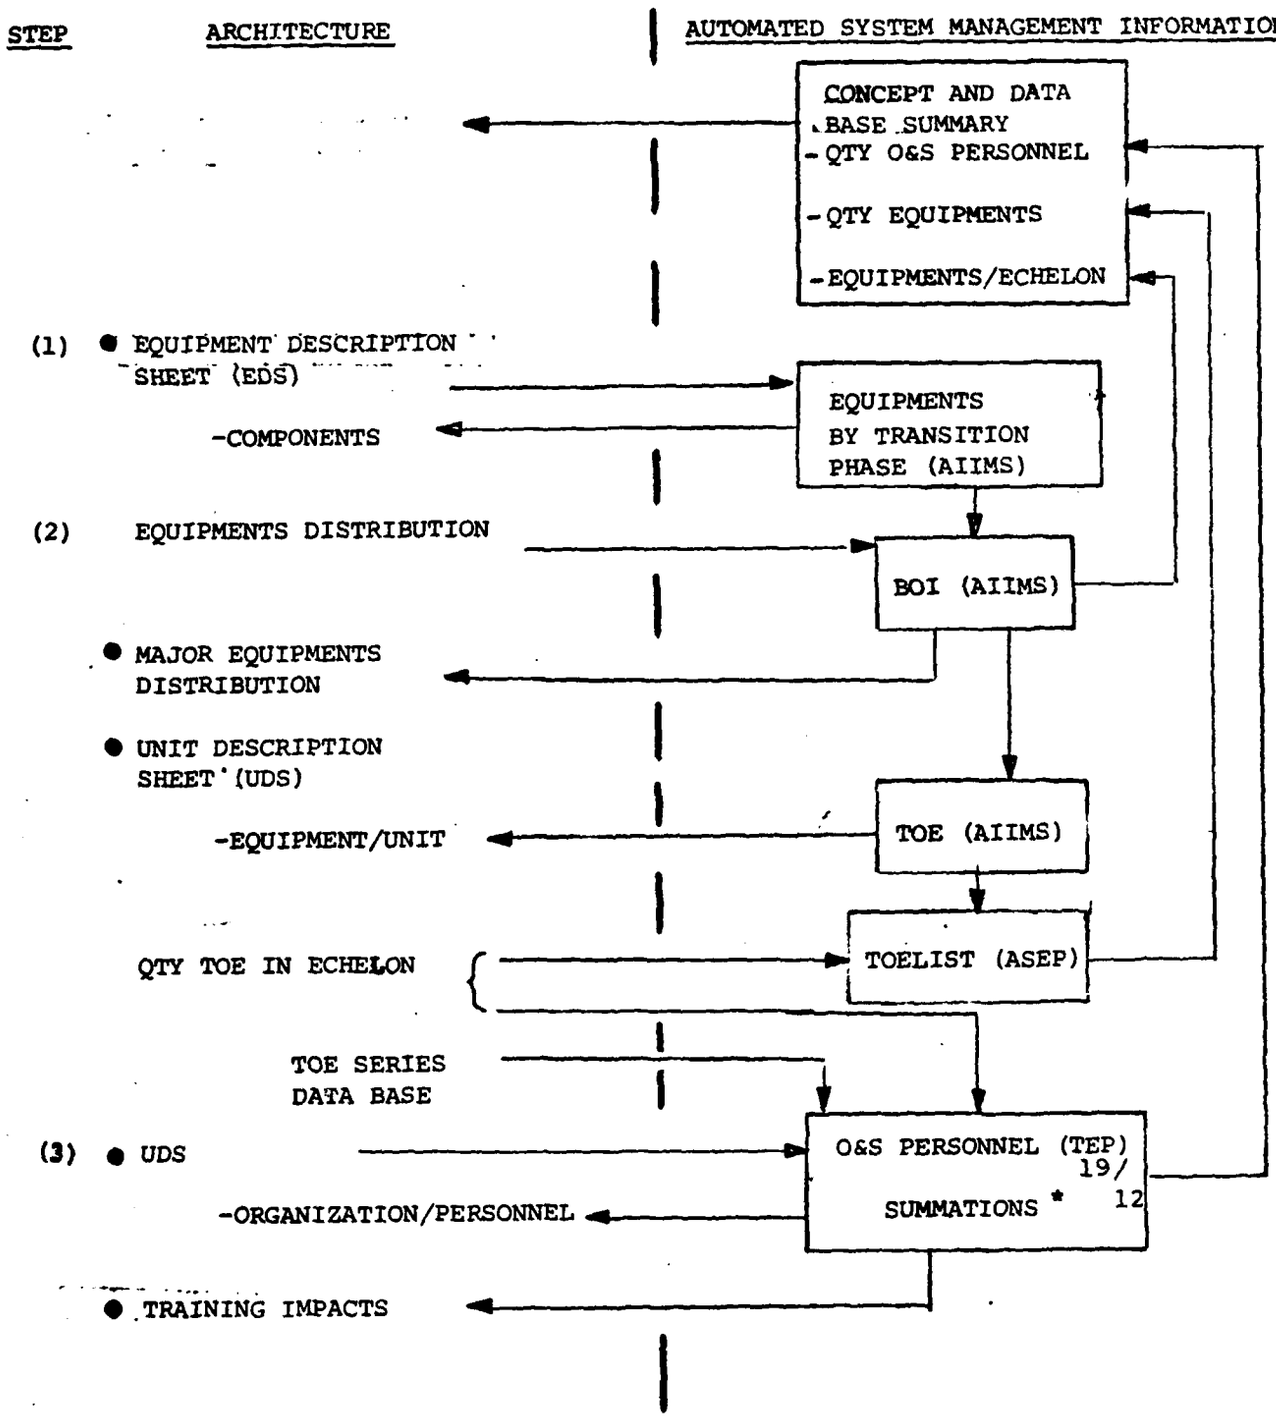
NOTES:

Figure 2-3 AUTOMATED CHANGE INCORPORATION PROCESS



in the Communications Support Plan Chapter of Architecture. Delete the replaced equipments on AIIMS lists. An equipment assemblage component print-out is returned as automated support of the Architecture document. Based on the given critical-event, developmental milestones and IOC, the new equipments must be introduced in one of five force Models which places them in a particular time frame. The next step involves who gets the equipment and what it replaces.

Step 2:

Read-in the distribution of the added equipments, and delete the replaced equipments in the BOI-file of AIIMS for the particular Force Model affected. For the Communications Support Plan Chapter, a print-out is returned to show Major Equipment Distribution. The BOI-file serves as the basis for adding or deleting significant equipments per echelon shown on the Concept and Data BAse Summary Table. Also, the TOE-file is automatically updated in AIIMS, and a print-out is the updated equipment page of the Unit Description Sheet in the Communications Support Plan Chapter.

An input definition of the quantity and type units in each echelon and type equipments of interest to the ASEP program. TOELIST, results in the automated summation of each type equipment in each echelon, which is entered in the Concept and Data Base Summary Table.

Step 3:

Provide the TOE organization diagram changes and signal personnel count in numbers of Officer (OFF), Warrant Officer (WO), Enlisted (ENL), as on the first page of the UDS in the Communication Support Plan Chapter. If the Changes are available in a TOE Series file, the Comparison Program, TEP 19, provides a listing of personnel by Grade and by MOS in each TOE. Summation results in totals by grade and totals by echelon. These summations of communications support personnel are used for update in the Training Impacts Section of the Communications Support Plan Chapter and in the Concept and Data Base Summary Table.

While the TEP programs are effective, considerable time-consuming manualmanipulation of data is required to arrive at the personnel strength levels. There is a need to develop a program which allows SIMO to directly access the TRADOC automated TOE personnel files at Ft. Leavenworth. A personnel program developed under the INTACS Study was operational in 1975. This program summarized communications support personnel in eight categories of MOS across a selected force model. This personnel program, updated and modified to sum by Officer, Warrant Officer, and

Enlisted personnel categories is described in Appendix C. Re-establishment of this program, as modified, will support the automated update of the INTACS architecture.

3.0 AUTOMATED SYSTEM MANAGEMENT INFORMATION (ASMI) REPORTING*

3.1 REPORTS

Reporting of System Management Information encompasses all the outputs of the Automated Transition Management System, including Architecture Update and System Evaluation Data, Acquisition and Distribution Implementation Schedules, Summaries and Base Data. A basic package of five reports as listed on Table 3-I is anticipated to be on automatic distribution four times a year to the specific agencies listed. In addition, SIMO will distribute baseline and evaluation data reports prior to working, Steering Committee and special meetings where exceptions to the plan are to be resolved. Other reports, listed in Appendix A are for reference and/or audit purposes and will be distributed upon request.

3.2 SCHEDULE

Distribution of inputs and outputs by automated means is a key factor for assuring delivery of data in time to support significant events. Figure 3-1 shows the periodic schedule for the electronic distribution of the inputs required by SIMO and the outputs at MILDEP levels in support of the four Planning, Programming, Budgeting System (PPBS) events listed. Table 3-II describes the four supporting events.

The System Integration and Architecture Element of SIMO validates all of the automated reports provided by the ADP Implementation Element via the Automated Transition Management System. For the reports on automatic distribution, the Implementation Element has the responsibility of assuring timeliness and notification of the proper individuals to provide validated information in the reports.

3.3 MANAGEMENT APPROACH

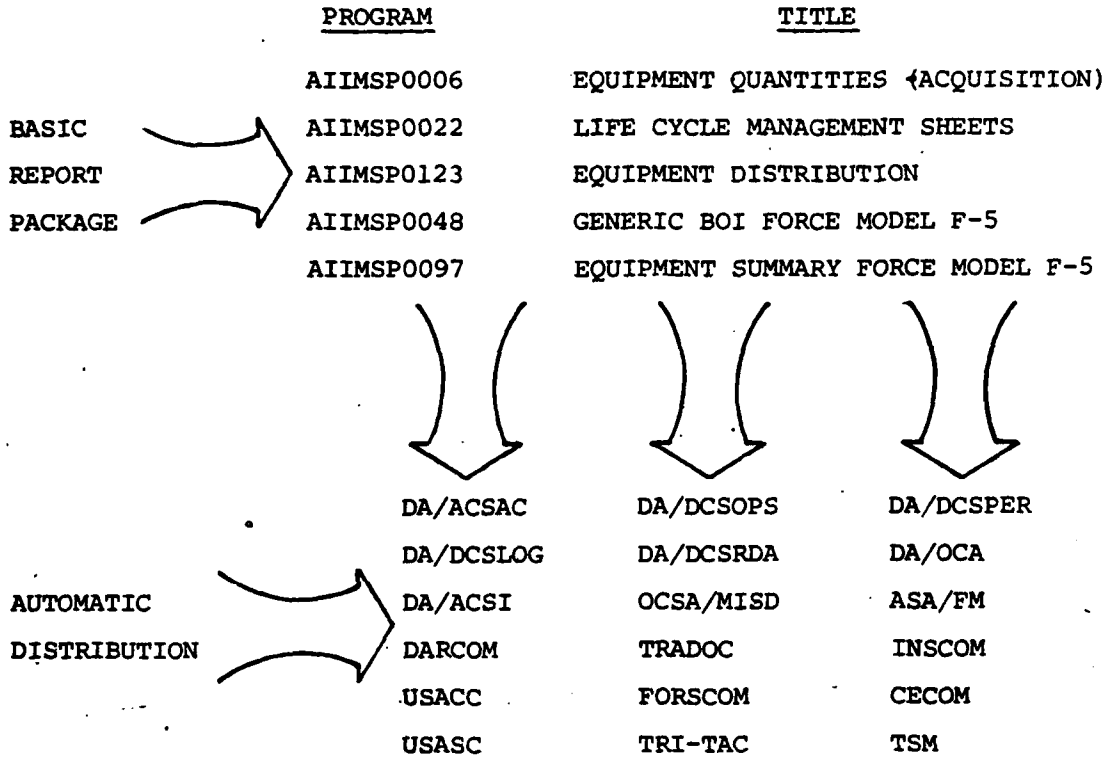
The SIMO management approach for the provision of Automated System Management Information which supports intensive management of the INTACS transition is shown in Figure 3-2 and is summarized as follows:

1. As the INTACS transitions from current to the objective system, the details of implementation reside in an extensive data base. With so many factors involved, it is essential that the data base and distribution concept be automated.
2. Recurring, validated inputs are provided by those agencies engaged in

* Also appears in paragraph 2.5.4 of SIMO Handbook.

TABLE 3-I

BASIC REPORT PACKAGE DISTRIBUTION



Notes:

1. Basic Report Package, above, distributed automatically to users in January, April, June and August.
2. Other reports, on attached Appendix A, Users Master List, are for reference and audit purposes and will be delivered upon request.

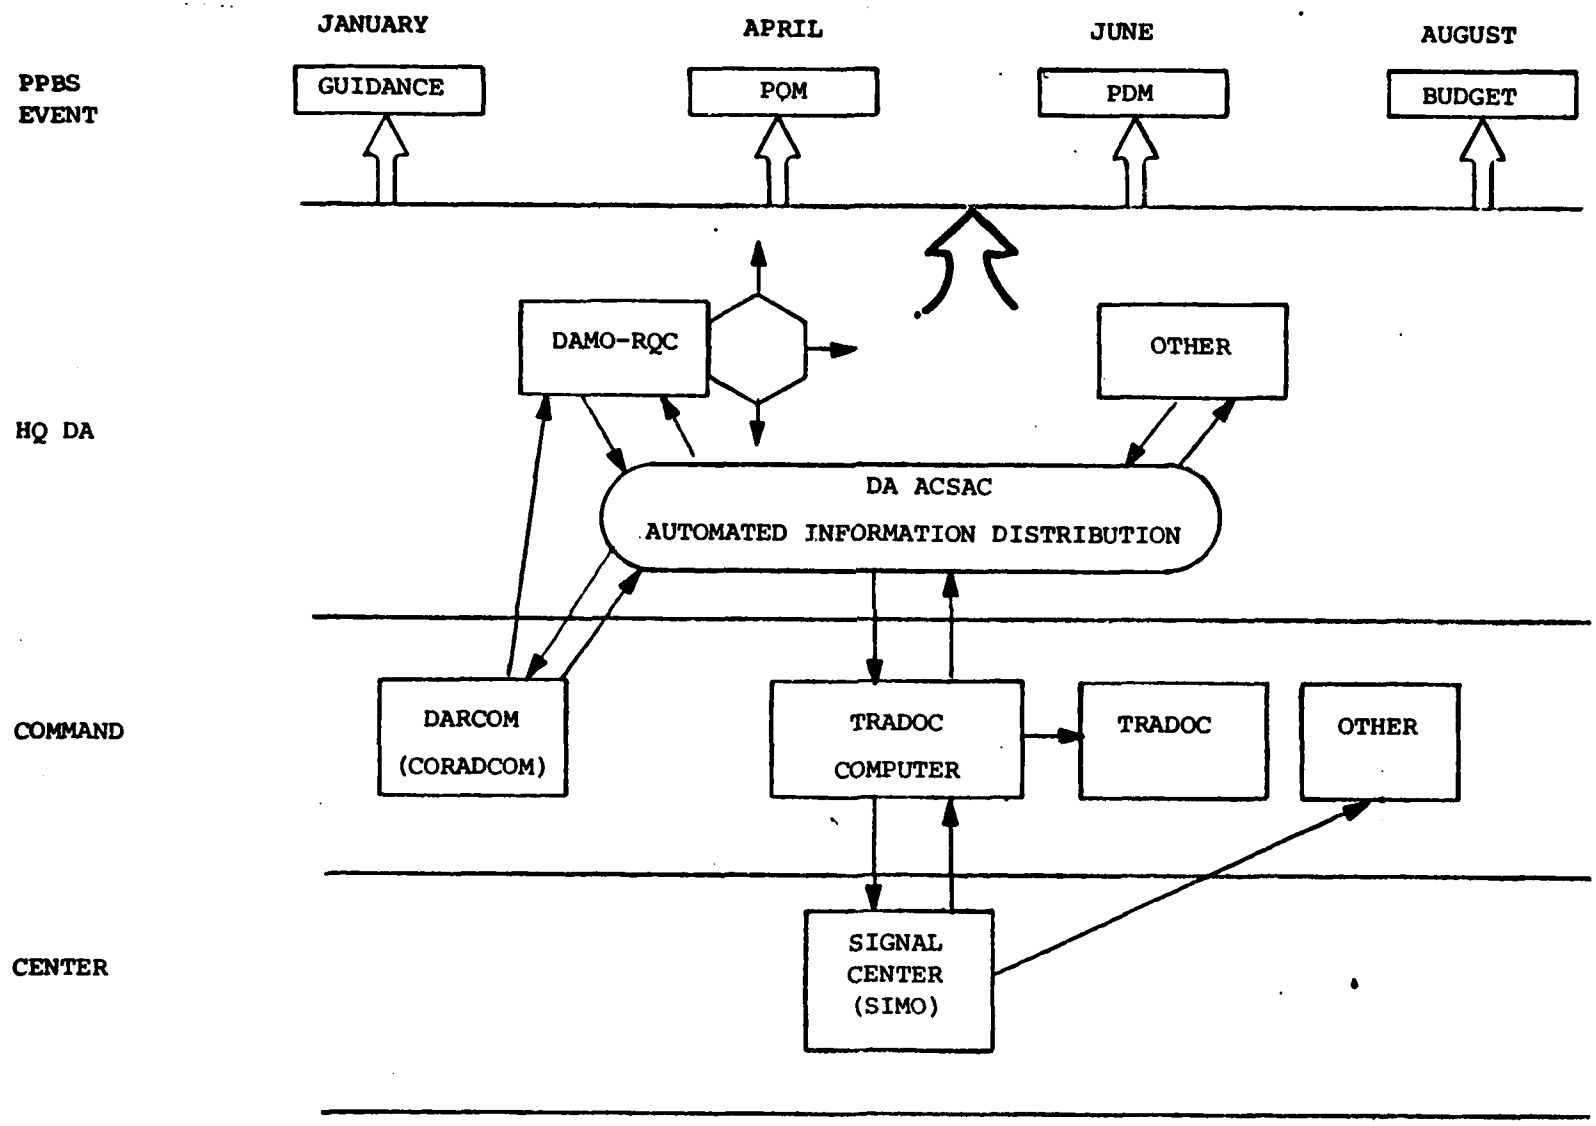


FIGURE 3-1 DISTRIBUTION DATA SCHEDULE ESTIMATE

TABLE 3-II

SCHEDULE EVENTS

JANUARY	SIMO receives set of inputs including priorities and force structure from DAMO-RQC and delivery schedules, current assets and feeder data from DARCOM. SIMO submits distribution data for basis information to support review and comment of SecDef Consolidated Guidance to Planning Programming Budgeting System (PPBS).
APRIL	SIMO receives set of inputs. SIMO submits distribution data for basis information to support PPBS Program Objective Memorandum (POM) and Five Year Defense Plan (FYDP) update.
JUNE	SIMO receives set of inputs. SIMO submits distribution data for basis information to support PPBS Program Decision Memoranda (PDM).
AUGUST	SIMO receives set of inputs. SIMO submits distribution data for basis information to support PPBS budget estimates and FYDP update.

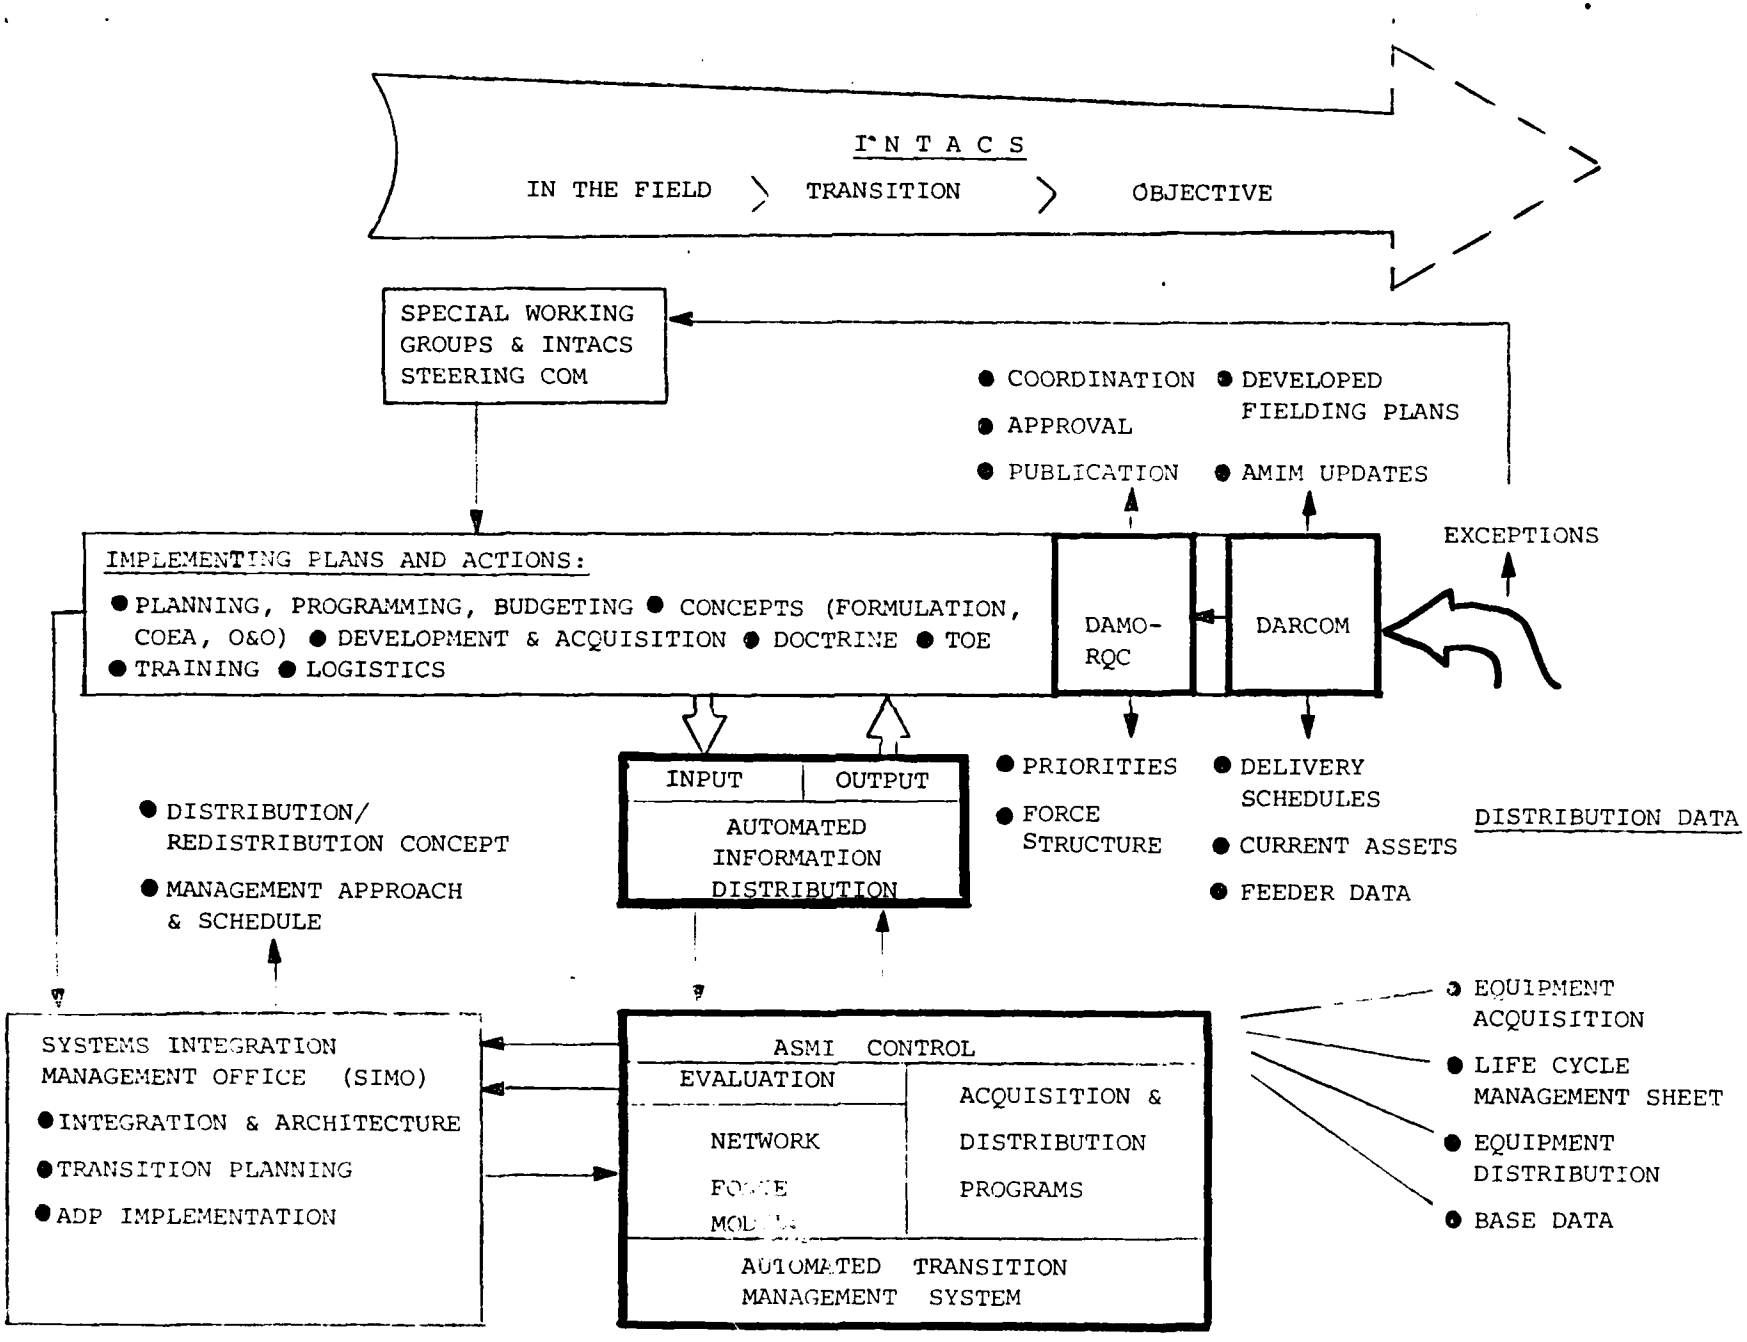

Figure 3-2 DISTRIBUTION PLANNING MANAGEMENT APPROACH

tactical communications plans and actions. The loop is closed by returning output distribution data to the same agencies. DARCOM assists TRADOC in the distribution planning effort by providing delivery schedule data, current assets and other feeder data. Based on the distribution data provided by SIMO, DARCOM develops materiel fielding plans and provides periodic AMIM updates. DAMO-RQC provides guidance pertaining to distribution priorities and force structure. All distribution/redistribution concepts are forwarded to DAMO-RQC by DARCOM for coordination, approval and publication as final distribution plans.

3. Distribution of both inputs and outputs to users is planned to be automated within DA ACSAC to assure timely receipt of basic input data and responsive delivery of output data.

4. SIMO develops and drives the Automated Transition Plan which includes base information, acquisition and distribution data.

5. SIMO analyzes inputs and evaluates the impact of significant conceptual and implementation changes to any of the phases of INTACS. Network transition force models are developed to represent the phases and are used as the basis for the distribution/redistribution concept. A series of five (5) force models for current, transition and objective systems have been developed to provide an orderly, compatible method of incorporating new equipment.

6. SIMO performs system integration and controls the outputs to insure that the distribution of TRITAC and other new equipments results in an optimal analog-digital hybrid architecture that is functional and supports the needs of the local commander. The distribution/redistribution concept is based on network transition to the INTACS objective architecture, force structure, distribution priorities, interoperability and geographical constraints. One form of the output distribution data is equipment assignment to units of the force by year.

7. When the transition and distribution plans are established, significant exceptions are resolved by special working groups and the INTACS Steering Committee (AR 15-23) using SIMO-furnished data as the baseline.

4.0 ASMI REPORTS PROCEDURES

4.1 REPORT GENERATION CONTROL PROCEDURES

A large and varied amount of reports and schedules are available to users from operating programs acting upon the SIMO Data Base. Some 27 outputs have been identified and are available through existing programs. Of these 27, those that deal with Force Models each have five outputs (F-1 through F-5). The total number will further increase by approximately ten when the fielding schedule phase is implemented.

To avoid a voluminous, unmanageable and unnecessary flow of data, each user and their particular requirements have been analyzed. From this a basic package of reports and schedules has been identified and consists of only five outputs. These outputs are relatively brief so as to require a minimum amount of time to transmit electronically. The remainder of the outputs are another format of the basic reports, a summary of the basic reports or are reference and/or audit information to be furnished upon request. The basic package, with the list of identified users, is shown in Table 4-I and will be transmitted automatically at scheduled times. The Master Users List of reports, by functional area and with illustrations, is attached as Appendix A.

4.1.1 Acquisition/Distribution

This functional area consists of eight outputs of which three will be contained in the basic package. Two are quality control assurance of the input data and the remaining three are re-formatted version of basic report outputs.

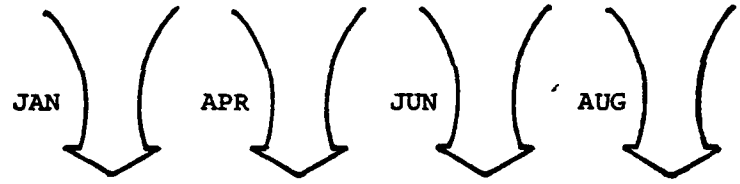
The reports in this area are the culmination of all the information in the SIMO Data Base, together with the preceding programs, and form the basis upon which budget decisions and equipment distribution plans can be made. New reports are generated each time there is a change in the budget, cost or basis of issue.

4.1.2 Equipment/Assemblages

There are seven user outputs in this functional area with all of them being available in the master form or in each Equipment Model from F-1 through F-5. None are included in the basic package but may be obtained upon request. They provide equipment reference data and the location of the items in the Force Models.

BASIC REPORT PACKAGE

AIIMSP0006	EQUIPMENT QUANTITIES (ACQUISITION)
AIIMSP0022	LIFE CYCLE MANAGEMENT SHEETS
AIIMSP0123	EQUIPMENT DISTRIBUTION
AIIMSP0048	GENERIC BOI FORCE MODEL F-5
AIIMSP0097	EQUIPMENT SUMMARY FORCE MODEL F-5



USERS	DA/ACSAC	DA/DCSOPS	DA/DCSPER
	DA/DCSLOG	DA/DCSRDA	DA/OCA
	DA/ACSI	OCSA/MISD	ASA/FM
	DARCOM	TRADOC	INSCOM
	USACC	FORSCOM	CECOM
	USASC	TRI-TAC	TSMs

TABLE 4-I BASIC REPORT PACKAGE AND DISTRIBUTION

4.1.3 POM Force

Only one program is available in this area, but it provides the Force for each of the projected five years. The Master POM is already available to all users, but the condensed force version may be obtained upon request since this will provide the Force against which acquisition and distribution schedules are run.

4.1.4 Force Models

This area consists of 11 basic user outputs with most of them being available in consolidated format and in the Force Model F-1 through F-5 versions. Two of these outputs are included in the basic package to provide the user with ready reference data on BOI and a summary of the force used.

These programs provide a variety of data on BOIs, TOEs, assemblages and components as they relate to units, both generically and by the selected force. They provide both reference data and an audit trail for the acquisition and distribution schedules. Those not included in the basic package are relatively lengthy, do not change frequently and, therefore, will be furnished only upon special request.

4.1.5 Report Request Procedure

As stated above, the basic package will be sent automatically to the listed, pre-selected users. Other agencies who have a requirement for the basic package on a periodic or one-time basis may request same from the U.S. Army Signal Center, Attn: ATZH-CDI. Other reports on the Master Users List may be obtained in the same manner.

4.1.6 Internal Procedures

The Implementation Element of SIMO receives all requests for reports to be generated through ASMI. They maintain the master schedule for periodic reports and log/schedule requests for special reports, which are all reports other than periodic.

When a request is received, the Documentation Index will be checked to see if the report has a current validation. If the validation date is more than three months old or if a data base update is involved, the AIIMS program will be executed, through a work request to AIIMS, and the report sent to the System Integration and Architecture Element of SIMO for validation. After validation, the newly validated report will be placed in the appropriate

SIMO Book (Table 1-2, INTACS Transition and Management Plan), The documentation Index will be updated, and the report will be released to the requestor.

If validation is not required, a work request will be sent to AIIMS where the report will be generated as per the procedures in paragraphs 4.1.7 and 4.2.

4.1.7 Production Control

A Production Control position within the Implementation Element of SIMO is required to provide and control distribution of the special and periodic production runs. This is a responsible position that must provide positive assurance that the data base is validated prior to the release of reports. The procedures for this position applicable to special and periodic reports follows:

1. Associate the report request with the Documentation Index to determine programs and files necessary to produce the report. Determine the validation date of the data base required for production of the requested report.
2. If the validation date is older than three months, acquire validated information or the authorization to proceed from the Implementation Element Chief.
3. Utilize the Program Documentation Record for instructions; enter the validation date, if new date is received, and execute programs to produce the report.
4. Notify those users on electronic mail service that the report is ready or deliver a copy of the report to the Implementation Chief for other users.
5. Refer to Automated Logging System (4.2) for the remaining procedure.

4.2 AUTOMATED LOGGING SYSTEM

Due to the large number of reports and the frequency with which they are generated by computer, it is necessary to have an automated logging system to control the distribution. This will permit management to insure, first; that the report is generated as per schedule, and second; that the user made access and received the report as scheduled.

When a report is generated, it will be placed into storage as a file and the name of the report and address of the storage location placed in the automated logging routine. The user will access the system by doing a

"system log-in" and then bringing up "SIMOLOG". This will activate the routine for the automated logging system. The user enters his I.D. and the report name which will automatically be transferred to a permanent log along with the time. After receiving the report, the user will log-out which will verify that the report has been received and the information will again be transferred to the permanent log. For local users, the same procedures will be used but with the SIMO ADP Operators using the customer I.D. to obtain his report. The report will then be sent to the SIMO Implementation Chief who is responsible for making the delivery. A simplified flow diagram of the system is shown in Figure 4-1.

The automated log will be printed out weekly with the copy going to the Implementation Element who will compare the automated log with the master schedule and special request log. Any discrepancies will be resolved through coordination with the user.

4.3 ELECTRONIC DISTRIBUTION AND INPUT SYSTEM

4.3.1 Outputs

To be effective, the Automated System Management Information (ASMI) process must be responsive to the users' requirements and provide a reasonably fast computer turn-around and delivery service. Particular emphasis is placed on this during the budgeting cycle when a baseline run plus several variations may be required. During this time, short suspenses develop and material may be required within two or three days.

The key to the successful operation of a responsive system is the DA ACSAC Automated Information Distribution Center as shown in Figure 4-2. The majority of the users, shown in Table 4-I, can be served through this center. Once the information is compiled and put in storage the user makes electronic access as discussed in paragraph 4.2, Automated Logging System.

4.3.2 Inputs

Also shown in Figure 4.2 is a list of input requirements that are necessary to make report updates. These are shown by the agency which has primary staff responsibility for this data. The DA ACSAC Automated Information Distribution Center will coordinate these inputs and transmit them to the TRADOC computer. SIMO will then access them and transfer the information to the appropriate data base.

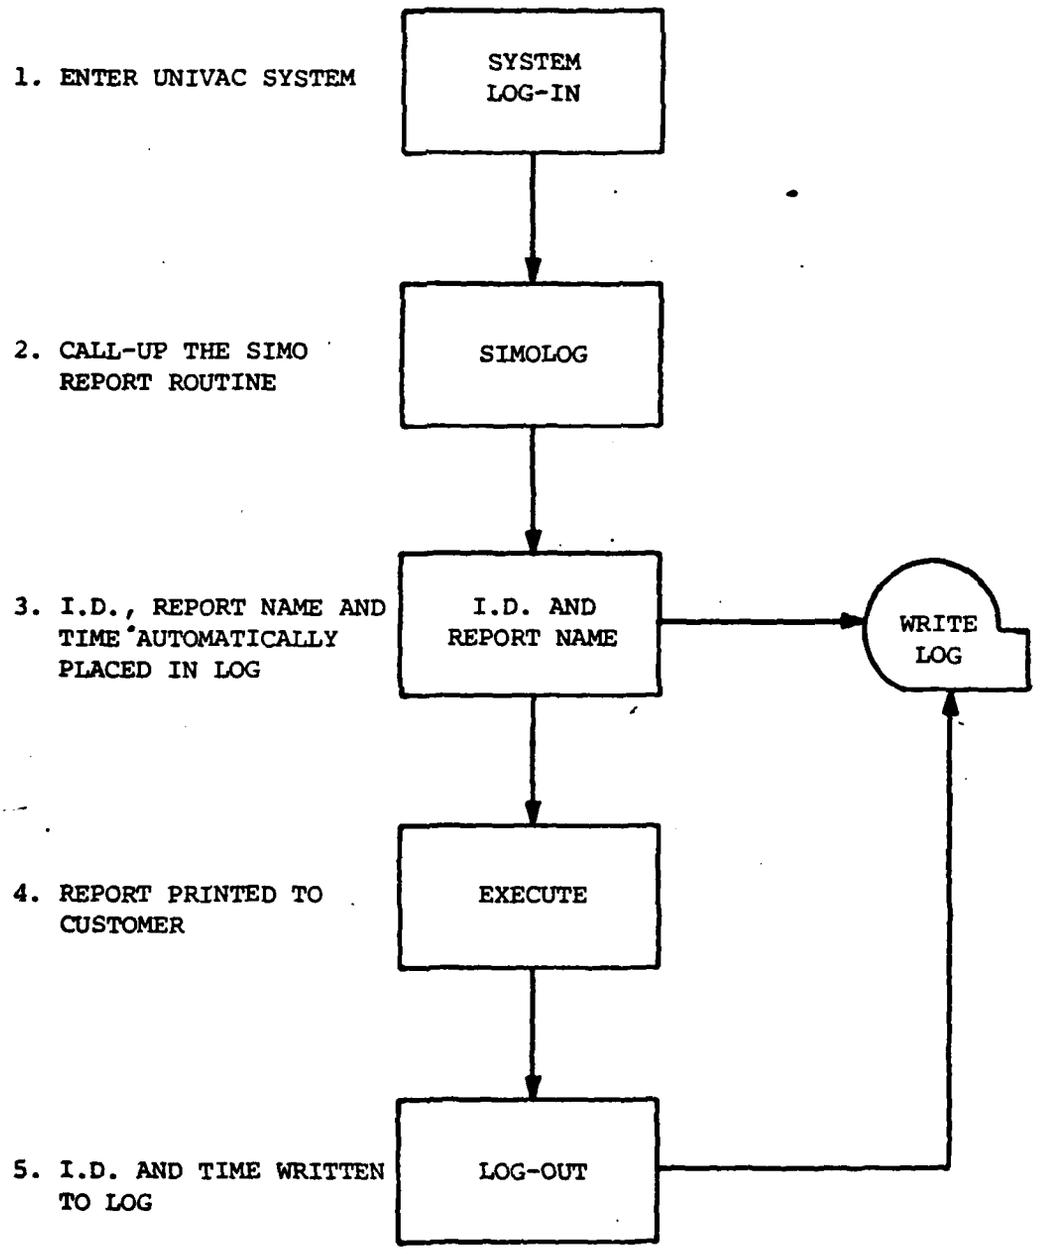


FIGURE 4-1 USER ACCESS AND LOGGING PROCEDURE

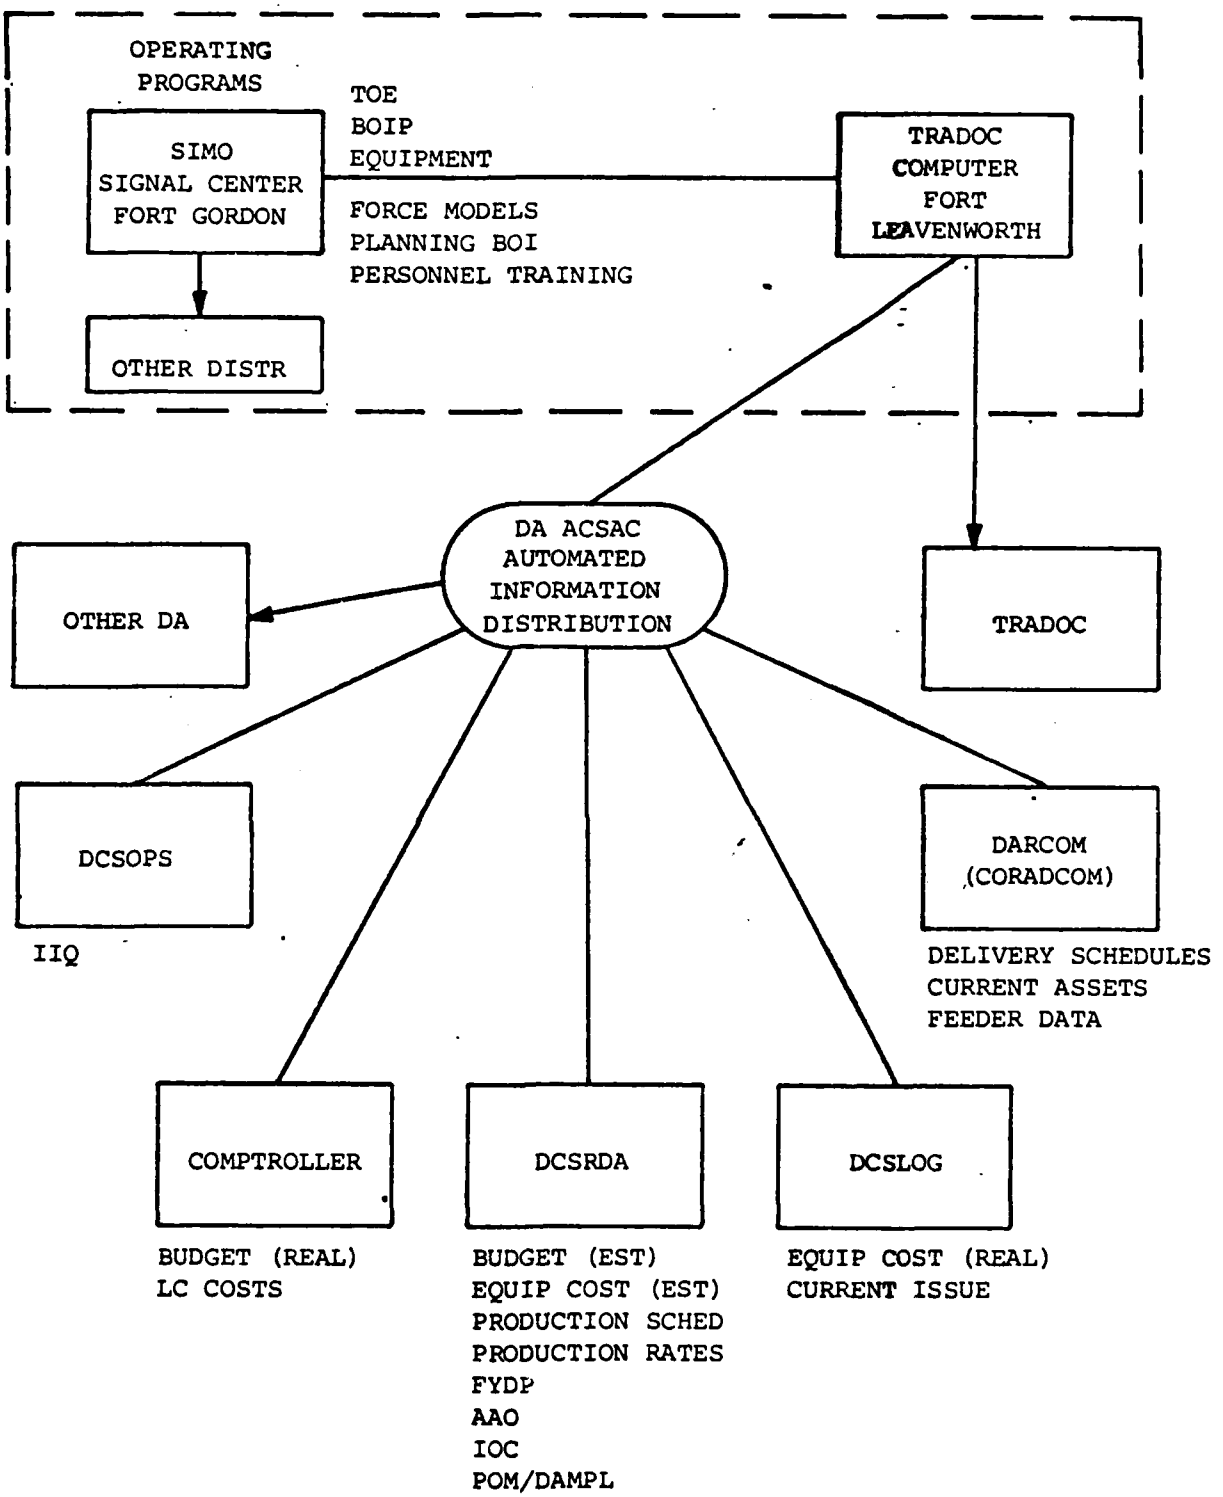

FIGURE 4-2 SIMO INPUT, OUTPUT DISTRIBUTION SYSTEM

5.0 ASMI PROGRAMS AND USERS REFERENCE HANDBOOK

This handbook is to be kept under separate cover and will provide SIMO with a ready reference source for current information on programs, reports, files and user requirements pertaining to the SIMO automated transition data base and reporting system. Also included will be planning data on system expansion and updating. The reference material itself is primarily computer generated and, as such, will be self-updating as changes in the system occur. Conversely, user lists and their report requirements will be updated through the staff action request procedure. Similarly, updates, projects, and system refinements reference information will be available as a result of planning conferences and meetings among management, operations and user personnel.

Shown below is the recommended index for the handbook with a summary of each topic to be included. Experience and operational requirements may dictate the inclusion of additional material as the system progresses, therefore the sections have been left broad enough to accommodate this material.

SECTION I - PROGRAM LISTINGS

TAB A - SIMO MASTER PROGRAM LISTING - A master index of all programs used by AIIMS. Entitled as Program Documentation Record, this index is kept current by AIIMS personnel using Program DOCP0002.

TAB B - SIMO MASTER FILE LISTING - A master index of files used by AIIMS. This index is kept current by Program DOCP0003.

TAB C - USER PROGRAM LIST - An extract from the Master Program Listing which shows only the output programs for user reports and schedules. These program numbers will be the ones by which users request information.

SECTION II - USER INFORMATION

TAB A - USER LIST - A listing of the users with organization. address, office code, point-of-contact, telephone number and assigned I.D.

TAB B - USER/REPORT/DUE DATE MATRIX - The matrix will show user I.D., program number and date program required. Example follows:

PROGRAM / OFFICE	AIIMSP0006	AIIMSP0003	AIIMSP0123	
DA DCSOPS	JAN APR JUN AUG	JAN APR JUN AUG	JAN APR JUN AUG	
DA DCSRDA	JAN APR JUN AUG	JAN APR JUN AUG	JAN APR JUN AUG	

SECTION III - PROGRAM STATUS/SCHEDULES

TAB A - AIIMS SYSTEM UPDATES AND PROJECTS (PLANNED) - Description of changes and refinements planned in the ADP system with projected start and finish dates.

TAB B - NEW REPORTS AND USERS (PLANNED) - Planned output changes or new information to be generated along with potential users.

TAB C - LOGS - Current copies of automated logs of user access.

SECTION IX - PROGRAM HEADERS - Banner sheets and samples of user program runs.

APPENDIX A

AIIMS REPORTS

FIGURE	TITLE	CLASS	DESCRIPTION	PROGRAM NR.
	ACQUISITION/DISTRIBUTION

26	ASSEMBLAGES BY FORCE	CONF	Assemblages with components by force F1-F5 within equipment category.	AIIMSP0093
27	COMPONENTS BY FORCE	CONF	Components to assemblages by force F1-F5.	AIIMSP0095

THE EQUIPMENT QUANTITIES PROGRAM PRODUCES A FORECAST OF EQUIPMENT BUYS BY BUDGET YEARS BASED ON INPUTS OF FYDP, BUDGET AND COST RULES FOR FUTURE YEARS, AND THE EQUIPMENT IIQ OR AAD.

THE INFORMATION UNDER COLUMN HEADINGS IS :

1. KEY NUMBER - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
2. NOMENCLATURE - EQUIPMENT IDENTIFICATION.
3. FISCAL YEAR - BUDGET YEAR FOR EQUIPMENT FORECAST.
4. BUDGET - FIXED AND/OR CALCULATED FROM FYDP PLUS CURRENT GUIDANCE. CURRENT RULES MAY BE OBTAINED FROM SIMO.
5. SURPLUS - EXCESS OF BUDGET OVER COST BY EQUIPMENT BY FISCAL YEAR.
6. COST - EQUIPMENT UNIT COST BASED ON GIVEN INPUT OR CALCULATED BYCURRENT GUIDANCE FOR EACH FISCAL YEAR.
7. ANNUAL BUY - QUANTITY OF EQUIPMENT TO BE BOUGHT EACH FISCAL YEARBASED ON BUDGET AND COST.
8. CUM BUY - CUMULATIVE BUY OF EQUIPMENT OVER THE FISCAL YEARS.
9. AAD REMAINING - TOP FIGURE IS THE TOTAL AAD OR IIQ - SUBSEQENT FIGURES ARE REDUCED BY ANNUAL BUY.

NOTES: A. AIIMS PROGRAM AI145P0107 SUMMARIZES THIS PRINT BY TOTAL EQUIPMENT PER FISCAL YEAR.

B. AIIMS PROGRAM AI145P0123 PROVIDES THE SPECIFIC UNIT DISTRIBUTION PLAN FOR THIS EQUIPMENT FORECAST.

QUESTIONS SHOULD BE ADDRESSED TO USASC-SIMO AUTOVON 780-3182/3671.

THE EQUIPMENT DISTRIBUTION BY UNIT AND BUDGET YEAR LISTS THE UNIT AND ALL THE SPECIFIED EQUIPMENT FORECAST FOR THAT UNIT BY BUDGET YEAR.

THE INFORMATION UNDER COLUMN HEADINGS IS :

1. DAMPL - DEPARTMENT OF THE ARMY MASTER PRIORITY LIST SEQUENCE NUMBER.
2. LOC - ABBREVIATED GEOGRAPHICAL LOCATION.
3. UIC - UNIT IDENTIFICATION CODE.
4. UNIT-ID - UNIT NUMERICAL DESIGNATION.
5. UNIT NOMENCLATURE - UNIT NAME.
6. SRC - STANDARD REQUIREMENT CODE - UNIT TOE NUMBER.
7. KEY NUMBER - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
8. KEY NOMENCLATURE/KEY DESCRIPTION - EQUIPMENT IDENTIFICATION.
9. QTY REQ - AUTHORIZED AMOUNT OF EQUIPMENT PER UNIT.
10. YEAR BUDGETED - AMOUNT OF EQUIPMENT BY FISCAL YEAR.

NOTE: INFORMATION FOR THIS SUMMARY IS DERIVED FROM AIIMS PROGRAM AIIMSP0123, EQUIPMENT DISTRIBUTION BY BUDGET YEAR TO UNITS.

QUESTIONS SHOULD BE ADDRESSED TO USASC-SIMD AUTOVON 780-3182/3671.

THE MASTER EQUIPMENT LIST IS A COMPLETE LIST OF INTACS EQUIPMENT FOR CURRENT, TRANSITION AND OBJECTIVE SYSTEMS. IT IS THE ATIMS EQUIPMENT DATA BASE FROM WHICH ALL OTHER LISTS AND SCHEDULES ARE DERIVED.

THE FOLLOWING INFORMATION IS FURNISHED:

1. KEY # - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
2. NOMENCLATURE, ACRONYM, DESCRIPTION - EQUIPMENT IDENTIFICATION.
3. EOIP # - BASIS OF ISSUE PLAN FOR FUTURE EQUIPMENT.
4. LINE # - LIN-ALPHAMERIC LINE ITEM NUMBER IDENTIFICATION OF A GENERIC NOMENCLATURE.
5. SSN - STANDARD STUDY NUMBER - FUNDING NUMBER ASSIGNED TO APPROVED PROCUREMENT ITEMS.
6. ACN - ACTION CONTROL NUMBER ASSIGNED TO TRACK ALL ACTIONS PERTAINING TO A PROGRAM.
7. FUND YR - INITIAL FUNDING YEAR.
8. IOC - INITIAL OPERATIONAL CAPABILITY - TIME WHEN EQUIPMENT AND TRAINED PERSONNEL CAN BE DEPLOYED.

LAST REVISION TO THE DATA BASE WAS MADE ON (REVESION DATE) (** APR 30,1981 **).

THIS REPORT IS AVAILABLE SORTED BY ANY COLUMN IT CONTAINS AND BY EQUIPMENT CATEGORY IN COMBINATION WITH THE COLUMN SORTS.

QUESTIONS SHOULD BE ADDRESSED TO JSASC-SIMD AUTOVON 730-3182/3671.

FIGURE 14

EQUIPMENT LIST F-5 IS A LISTING OF THE INTACS OBJECTIVE SYSTEM WHICH IS DERIVED FROM THE MASTER EQUIPMENT FILE.

THE FOLLOWING INFORMATION IS FURNISHED:

1. KEY # - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
2. NOMENCLATURE, ACRONYM, DESCRIPTION - EQUIPMENT IDENTIFICATION.
3. BOIP # - BASIS OF ISSUE PLAN FOR FUTURE EQUIPMENT.
4. LINE # -LIN-ALPHAMERIC LINE ITEM NUMBER IDENTIFICATION OF A GENERIC NOMENCLATURE.
5. SSN - STANDARD STUDY NUMBER - FUNDING NUMBER ASSIGNED TO APPROVED PROCUREMENT ITEMS.
6. ACN - ACTION CONTROL NUMBER ASSIGNED TO TRACK ALL ACTIONS PERTAINING TO A PROGRAM.
7. FUND YR - INITIAL FUNDING YEAR.
8. IOC - INITIAL OPERATIONAL CAPABILITY - TIME WHEN EQUIPMENT AND TRAINED PERSONNEL CAN BE DEPLOYED.

LAST REVISION TO THE DATA BASE WAS MADE ON [REVISION DATE] (** MAR 3,1981 **).

THIS REPORT IS AVAILABLE ONLY BY EQUIPMENT CATEGORY, BUT MAY BE SORTED BY ANY COLUMN WITHIN CATEGORY.

QUESTIONS SHOULD BE ADDRESSED TO JSASC-SIMD AUTOVON 230-3182/3671.

GENERIC TOE FILE BY FORCE F-S (OBJECTIVE SYSTEM) PROVIDES A LISTING OF ALL THE UNITS IN THE FORCE AND THE EQUIPMENT AND QUANTITIES ASSIGNED TO EACH.

THE [illegible] WORDS FOLLOW HEADINGS ARE:
1. SEC & UIC & TYPE UNIT - UNIT IDENTIFICATION.
2. KEY NUMBER - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
3. NOMENCLATURE (NO) DESCRIPTION - EQUIPMENT IDENTIFICATION.
4. EQ QUAN - AMOUNT OF EQUIPMENT PER EACH TOE.

NOTES: 1. TOE & QUAN BASED ON COMBINATION OF INTACS OBJECTIVE SYSTEM & APPROVED BOIPS.
2. EXAMPLE TOE- 11-035H000 = INTACS PLANNED TOE
11-035H00D = REAL TOE

LAST REVISION TO THE DATA BASE WAS MADE ON (PROCESSING DATE) (00 MAR 81)1981 001.

QUESTIONS SHOULD BE ADDRESSED TO JDASE-SIMO AUTOVON 780-3182/3671.

FIGURE 19A

GENERIC TOE FILE BY FORCE F-5 (OBJECTIVE SYSTEM) PROVIDES A LISTING OF ALL THE UNITS IN THE FORCE AND THE EQUIPMENT AND QUANTITIES ASSIGNED TO EACH.

THE INFORMATION UNDER COLUMN HEADINGS IS :

1. SRC / TOE / TIF NAME - UNIT IDENTIFICATION.
2. KEY NUMBER - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
3. NOMENCLATURE AND DESCRIPTION - EQUIPMENT IDENTIFICATION.
4. EQ QUAN - AMOUNT OF EQUIPMENT PER EACH TOE.

NOTES: 1. TOE & QUAN BASED ON COMBINATION OF INTACS OBJECTIVE SYSTEM & APPROVED BOIPS.
2. EXAMPLE TOE- 11-035M*** = INTACS PLANNED TOE
11-035M000 = REAL TOE

LAST REVISION TO THE DATA BASE WAS MADE ON (REVISION DATE) *** MAR 3,1981 ***.

QUESTIONS SHOULD BE ADDRESSED TO JSASC-SIMO AUTOVON 780-3182/3671.

FIGURE 33

SAME FORMAT AS FIGURE 19A BUT WITH 'COMPONENT ONLY' ITEMS AT END OF RUN.

FIGURE 20A

GENERIC BDI FILE BY FORCE F-5 (OBJECTIVE SYSTEM) PROVIDES A LISTING OF ALL THE EQUIPMENT IN THE FORCE, THE TOE AND THE AMOUNT OF EQUIPMENT IN EACH TOE.

THE FOLLOWING INFORMATION IS FURNISHED:

1. KEY # - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
2. NOMENCLATURE AND DESCRIPTION - EQUIPMENT IDENTIFICATION.
3. TOE NR / TOE NAME - UNIT IDENTIFICATION.
4. EQ QUAN - AMOUNT OF EQUIPMENT PER EACH TOE.

NOTES: 1. TOE'S WERE BASED ON COMBINATION OF INTACS OBJECTIVE SYSTEM & APPROVED BOIPS.

2. EXAMPLE TOE- 11-035H*** = INTACS PLANNED TOE
11-035H000 = REAL TOE

LAST REVISION TO THE DATA BASE WAS MADE ON (REVISION DATE) (** MAR 3,1981 **).

QUESTIONS SHOULD BE ADDRESSED TO USASC-SIMO AUTOVON 780-3182/3671.

TOE FILE BY FORCE F-5 (OBJECTIVE SYSTEM) PROVIDES A LISTING OF ALL THE TOES IN THE FORCE THAT CONTAIN THE SELECTED EQUIPMENT, THE EQUIPMENT AND QUANTITY IN EACH TOE, AND THE TOTALS OF EQUIPMENT IN THE FORCE.

THE INFORMATION UNDER COLUMN HEADINGS IS :

1. SRC / TOE / TOE NAME - UNIT IDENTIFICATION.
2. KEY NUMBER - THE PERMANENT NUMBER OF AN EQUIPMENT IN THE DATA BASE.
3. NOMENCLATURE AND DESCRIPTION - EQUIPMENT IDENTIFICATION.
4. EQ QUAN - AMOUNT OF EQUIPMENT PER EACH TOE.
5. ACT/EQ - TOTAL ACTIVE ARMY EQUIPMENT IN THE FORCE.
6. NG/EQ - TOTAL NATIONALGUARD EQUIPMENT IN THE FORCE.
7. RES/EQ - TOTAL ARMY RESERVE EQUIPMENT IN THE FORCE.
8. TOT/EQ - TOTAL EQUIPMENT IN THE FORCE.
9. ACT - NUMBER OF ACTIVE ARMY UNITS IN THE FORCE.
10. NG - NUMBER OF NATIONAL GUARD UNITS IN THE FORCE.
11. RES - NUMBER OF RESERVE ARMY UNITS IN THE FORCE.
12. TOT - TOTAL NUMBER OF UNITS IN THE FORCE.

LAST REVISION TO THE DATA BASE WAS MADE ON (REVISION DATE) (** MAR 3,1981 **).

QUESTIONS SHOULD BE ADDRESSED TO JSASC-SIMO AUTOVON 780-3182/3671.

APPENDIX B

IMPACT EVALUATION PROCESSES AND PROGRAMS

1.0 INTRODUCTION

The computer outputs illustrated and described in this appendix support the impact evaluation processes discussed in Section 2.0. The data presented is sufficient to determine that the evaluation procedure is valid and can be used to detail the impacts of change to the architecture. It is assumed that this appendix will be the basis for demonstration of the evaluation process when current system problems caused by conversion to UNIVAC are corrected.

2.0 SELECTED FORCE DEFINITION

A selected force consisting of manually selected Standard Requirements Code (SRC) of various military units (Company, Battalion, Brigade) is used as a model for evaluating change impact. The size of the force selected can vary depending upon the scope of the evaluation. In selecting the force the analyst decides the quantity of each SRC to be included in the force and specifies at what level roll-up will occur. A roll-up SRC is discussed and illustrated in Section 4.1.

3.0 PERSONNEL AND EQUIPMENT COST COMPARISONS

This section illustrates the TRADOC TOE cost program TEP 19 which compares selected TOE and provides basic cost data for O&S personnel pay and allowance and equipment. These are the prime drivers of life cycle costs. The report provided by this program is in two major sections; personnel costs and equipment costs. The personnel section lists annual costs by grade and military occupation speciality (MOS) and prints out strength level and total cost difference. Table B-1 is an example of personnel cost comparison of the current TOE 11035H000 AIM Division Signal Battalion to TOE 11035S610 which is the planning TOE for the Heavy Division Signal Battalion. The last entry on this example shows a personnel strength requirement for TOE 11035H000 of 702 as compared to a personnel requirement of 801 for TOE 11035S610. By following the columns across to the extreme lower right it can be determined that the additional 99 personnel required for TOE 11035S610 will result in an additional annual cost of $1,165,270.

TABLE B-1 TEP 19 Example Personnel Cost Data

As shown on Table B-2, the second section of this report compares equipment cost. For example, the last entry on this table shows that Radio Set, AN/GRC-( )-(V5) costs $1920 each. The table shows that TOE 11035H000 is not authorized any of these radios but TOE 11035S610 has an authorized allowance of 68. The last column shows that the addition of 68 of these radio sets to TOE 11035S610 will cost $130,560. Considerable manual effort is required to sum the costs for each unit into the total cost for the entire selected force. In the future it may be possible to modify the programs illustrated in Section 4.0 below to roll-up and summarize equipment cost and O&S personnel cost in a manner similar to the effectiveness data. In addition, the output report of TEP 19 provides changes in quantity and type of signal equipment planned in the selected units, and the program identifies by MOS code and grade the number of O&M signal personnel assigned in the planned units. Manual screening is required to identify only signal personnel and equipment. When the screening process is complete, equipment change data and signal personnel evaluation data is extracted and prepared as input to the system definition and evaluation programs discussed below.

4.0 SYSTEM DEFINITION AND EFFECTIVENESS MEASUREMENT[1]

4.1 SYSTEM DEFINITION MODEL (TOELIST)

This section describes previous programming actions taken to implement an Equipment Assignments to Force Units Procedure which results in a force - equipment system definition called TOELIST.

The AIIMS Data Base contains the equipment issue basis for current, three Transition and the Objective Systems of INTACS. The data base itself is classified because it contains the Program Objective Memorandum (POM) force and consequently the equipment required to support that force. By specifying an unclassified generic force model, the equipment issue basis by TOE unit in the AIIMS Data Base can be used to determine equipment requirements for a selected force.

Within the selected force file, a "roll-up" SRC is one which will represent a summation of other "sub-SRCs". For example, Table B-3 is a computer printout of the force file used to demonstrate the System Definition Program and is a doctrinal Armored Division with its associated Corps units.

TABLE B-3 Force_Units File

The SRC 06300H given in the left-most column is a "roll-up" SRC for Division Artillery (DIVARTY). Its associated "sub SRCs" or subordinate units are listed in third column from the left and the quantity of those units in the right-most column. Other "roll-ups" are made for the Division Signal Battalion (SIG BN), Division Support Command (DISCOM), Division Air Defense Artillery Battalion (ADA BN) and for the Corps units located in the Division area. The purpose of this "roll-up" process it to allow the analyst to view the equipment requirements within certain critical functional areas i.e. fire support (DIVARTY), command and control (SIG BN), administration and logistics (DISCOM) and air defense (ADA BN).

In order to allow for broader use of this process and preclude the program from "bombing" due to a SRC that is specified in the force file but not in the AIIMS Data Base, a comparison routine was developed. Its purpose is to scan the force file input, compare with the SRCs in the specified AIIMS Force Model and alert the analyst as to those SRCs not available on file. Table B-4 is a reproduction of this Force File/AIIMS Data Base SRC Filter. At the lower left hand corner of the table in the program's output it indicates that of the SRCs contained in the force file, 06307H (Division Target Acquisition Battery), 30165H (Division CEWI Battalion) and 41207H (Corps Civil Affairs Company) are not contained in the AIIMS Data Base. At this point the analyst must either develop the equipment issue basis and inject it or delete that unit from the selected force. For the output example given later, the issue basis for SRCs 06307H and 41207H were manually derived, input to a separate data base and injected in the program. The issue basis for the CEWI Bn (30165H) was not input for the example program output.

With the foregoing inputs, the program lists the equipment quantity in each SRC, multiplies the number of like SRCs by the equipment in each and sums the total equipment by "roll-up" SRC number. Table B-5 is a sample of the output for SRC 06300H, DIVARTY.

The final step in the program sums the roll-up SRCs to arrive at the total number of each type of equipment required to support the whole selected force. Table B-6 is the sample output of the System Definition Program for the force contained in Table B-3 in terms of the INTACS Objective System equipments.

A program is available to inject changes of unit and equipments to the System as represented by TOELIST.

TABLE B-6 Sample Output of Equipment Assignment Program for Force Listed in Table B-3 for INTACS Objective System Equipments. (TOELIST)

4.2 EFFECTIVENESS MEASUREMENT (MOETOELIST)

This section describes programming efforts to implement the Equipment Related MOE Effectiveness Measurement Procedure called MOETOELIST. The procedure is essentially a set of straight-forward arithmetic calculations aimed at deriving eleven of the INTACS Measures of Effectiveness (MOE): Weight, Volume, Total Power, Preventive and Corrective Maintenance Total and Without Test Equipment, Personnel, Transport Vehicles, Secure Subscribers and Equipment Categories for a defined communications system. As such, it is dependent upon the output of the System Definition Program (TOELIST) previously discussed in Section 4.1. In fact TOELIST is repeated in the beginning of MOETOELIST.

An Equipment Characteristics Data Base is required as input so that the eleven MOE can be derived for whatever equipment is used to define a system. Table B-7 is a sample format of this data base with indication of the source of the data. Samples of Weight, Cube, Wattage and Maintenance data available on computer files are shown on Tables B-7 A-C. A comparison between those items output from the System Definition Program and those items contained in the Equipment Characteristics Data Base is made at the outset so that those characteristics not in the data base are indicated early in the procedure.

A sample of the output of the Equipment Related MOE Effectiveness Measurement Program, MOETOELIST, is shown in Table B-8. While the sample only shows measurements for total force as the bottom line, the preceding portions of MOETOELIST show the same eleven measurements for each SRC and roll-up unit.

5.0 CONCLUSION

The full potential of this process will be realized only when system problems that have been created by conversion to UNIVAC are corrected.

The Impact Evaluation Process is a valid procedure which can be used to assess the impact of change to architecture. The results of evaluation may be used as a basis for selection of alternate courses of action or justification for the selected course of action.

TOTAL NUMBER U.S. PERSONNEL IS 52
TOTAL NUMBER SECURE SUBSCRIBERS IS 0

TABLE B-8 Sample Output MOETOFLIST

SIGNAL PERSONNEL REQUIREMENTS

This appendix describes a personnel program which was developed under the INTACS Study.

Army furnished Audit Trail (ALFA) - INTACS Personnel ADP Run 1975 was provided to simplify tracking the quantity of personnel in support of INTACS candidates. This program must be updated and slightly modified for summing by officer (OFF), Warrant Officer (WO), and Enlisted (ENL) in order for it to furnish the data required to support the update of INTACS Architecture.

Personnel ADP justification and outputs for the following requirements are described below:

- Signal MOS personnel in non-Signal units.
- All personnel in Signal units.

1.0 JUSTIFICATION FOR COMPUTER SUPPORT

In order to determine the number of Signal MOS personnel in the INTACS force model non-Signal units, programming for access to and formatting of data from the TOE file at Fort Leavenworth is required.

The magnitude of these audit trails is reflected by the following:

- There are approximately 400 discrete TOEs in the force model: 42 Signal and 358 non-Signal.

2.0 ADP SUPPORT REQUIRED

2.1 Force Model Listing (INTACS Study)

This is the prerequisite to subsequent listings:
Unit TOE's, quantity, by echelon.

2.2 Personnel

- Total Signal MOS personnel, (Enclosure 3), in all TOE's, subtotalled in 8 groups: Supvr/con (C&C), Radio (05), Wire, Switching, Comcen (TTY), COMSEC (KY), Multichannel, and Maintenance. Also, subtotal

by OFF, WO, and ENL. (See Enclosure 1 - Format)

- Non-Signal MOS personnel, (Other-Enclosure 4), in Signal TOE's subtotalled in 6 groups: P&A, Supply, Food Service, Aircraft O&M, Wheeled veh O&M (MTR), A/V. Also, subtotal by OFF, WO, and ENL. (See Enclosure 1)
- Roll-up MOS for each echelon and for Force. Also, subtotal by OFF, WO, and ENL. (See Enclosure 2)

3.0 OBJECTIVE SYSTEM

In addition to the foregoing, a TOE work file for the INTACS Objective System must be established and placed in the TOE data base file at Fort Leavenworth.

The INTACS study was approved by HQs Dept. of the Army on 17 February 1976 however to date no known effort has been made to formulate working draft TOE's to support the Objective System.

Basic information to support formulation of INTACS Objective System working draft TOE's is available in Task V and VI of the DA approved INTACS study and in the INTACS System Architecture (Objective System Refinement) dated May 1979. Chapter 2, TRADOC Pamphlet 71-4 provides procedures and guidance which are to be followed when placing working draft TOE into the TRADOC automated data files.

Placement of the INTACS Objective System TOE working file into the TRADOC data base will facilitate responsive and rapid update of the Objective System as approved changes occur.

- MOS's of concern include some 65 signal and 58 other specialties- or a total of 123 MOS's. The 65 signal MOS's are divided into 8 functional categories; ie.: Supervisory/control, radio, wire, switching, Comcen, COMSEC, multichannel, and maintenance.

The audit trails for INTACS started with data extracted from the Army TOE data bank to establish the baseline ALFA, followed by manual adjustment and rationale through each of the succeeding candidate designs. In order to reduce the manual effort to a manageable level within the time frame allowed, the following support/programming tasks were accomplished:

- Rearrange the force model card deck in terms of TOE's by echelon, by quantity.
- Enable extraction of MOS data by 14 functional groups in 1 run for signal MOS's and for non-signal.
- Enable the computer to scan TOE recapitulation sections and display total MOS groups per TOE.
- Enable the computer to search TOE paragraphs containing signal MOS's in non-signal units.

Enclosures:

1. Signal Personnel MOS Format
2. Personnel MOS Roll-up
3. MOS Grouping # 1-8, Signal
4. MOS Grouping # 1-6 Non-Signal
